## **ACKNOWLEDGEMENT**

First and foremost, I would like to express my highest gratitude to my supervisor Pn. Jasber Kaur for giving me the encouragement and mostly support throughout the time of this study. All hours spent in discuss were highly remembered as valuable experiences to guide more for my future. My thanks also go to the ITS 690 coordinator Pn Mardziah Hashim and Pn. Rogayah, for their exhortation and advice throughout the semester in carrying out this research. Without all these help and advices of both, this project would not be flourishing as I hoped it should be.

Special acknowledgment also goes to the board director of Selangor healthcare centre on giving me the authorization to distribute questionnaires in their clinics, Dr. Vickneswari A/P Ayadurai and also to all healthcare providers around Selangor, thank you for time spent in answering the questionnaires. With no expectation, a million of thanks go to both my parents who never give up supporting and stand back behind me. To my friends and to all whom I thrash out expertise and help me during the data collections, thank you.

To whom I forgot to mentioned, those who directly or indirectly contributed to this project, thank you very much.

Thank you.

## **ABSTRACT**

The explosion of mobile communication and computing technologies in supporting highly specialized task and services in healthcare has made it increasingly important to identify the level of acceptance among healthcare practitioners and factors that may be influencing the level of their acceptance. The wide adoption of mobile technology can potentially improve the information access, enhance workflow and promote evidence-based practice to make informed and effective decisions at the point of care.

This study will present the level of healthcare practitioners' acceptance toward the use of mobile technology in healthcare services. Other than that, this study also discussed about the benefits that gained by implementation of mobile technology in healthcare and what will influence the level of their acceptance. This study will use the extended TAM recommended by Wu, Wang and Lin (2005) in identifying the level of user acceptance.

The result shows that compatibility and computer self-efficiency have significant effect on behavioral intent. There will be 4 factors that may influence the level of user acceptance which are, technical support and training, management support, compatibility and computer self-efficiency. Among these factors, compatibility has the strongest relationship to the behavioral intention.
