UNIVERSITI TEKNOLOGI MARA

THE ROLE OF TOXOPLASMA GONDII (TG) IN SCHIZOPHRENIA: SEROFREQUENCY AND SEROINTENSITY OF TG

NOR FATINI ADAM

Thesis submitted in fulfilment of the requirements for the degree of Master of Science

Faculty of Medicine

April 2015
AUTHOR’S DECLARATION

I declare that the work in this thesis was carried out in accordance with the regulations of Universiti Teknologi MARA. It is original and is the result of my own work, unless otherwise indicated or acknowledged as referenced work. This thesis has not been submitted to any academic institution or non-academic institution for any degree or qualification.

I, hereby, acknowledge that I have been supplied with the Academic Rules and Regulations for Post Graduate, Universiti Teknologi MARA, regulating the conduct of my study and research.

Name of Student : Nor Fatini binti Adam
Student I.D. No : 2010801314
Programme : Master of Science
Faculty : Medicine
Thesis Title : The Role of Toxoplasma gondii (Tg) in Schizophrenia: Serofrequency and Serointensity of Tg

Signature of Student : ...........................................................
Date : April 2015
Infection with Toxoplasma gondii (Tg) in the central nervous system causes behavioural, personality changes and psychotic symptoms mimicking schizophrenia, a psychiatric illness with unknown aetiology. The aim of this study was to determine the seroprevalence, serointensity of Tg IgG, IgM antibodies and Tg DNA in patients with Schizophrenia and its relationship with demographic profile and clinical factors. This was a cross-sectional study examining the role of Tg in patients with Schizophrenia attending the Sg Buloh Hospital and University Malaya Medical Centre (UMMC) during a period from July 2010 to December 2012. A total of 156 subjects consisting of 57 patients with chronic Schizophrenia, 44 acute Schizophrenia and 55 healthy individuals participated in this study. The demographic profiles, risks and clinical factors were examined to determine the positivity and intensity of Tg IgG, IgM antibodies and Tg DNA. The seropositivity and serointensity of Tg antibodies were measured using Enzyme Linked Immunosorbent Assay (ELISA) while positivity and intensity Tg DNA were measured using Real Time PCR. The seropositivity of IgG antibody were significantly higher in all Schizophrenia, remission and acute Schizophrenia patients than control (p<0.001). The serointensity of IgG antibody were also significantly higher in all Schizophrenia, remission and acute Schizophrenia patients than control (p<0.05). The positivity of DNA Tg were also significantly higher in all Schizophrenia, remission and acute schizophrenia than control (p<0.05). The intensity of Tg DNA were also significantly higher in all Schizophrenia, remission and acute Schizophrenia patients than control (p<0.05). This study suggests that Tg has a significant role in Schizophrenia.
ACKNOWLEDGMENTS

Firstly, I wish to thank Allah for giving me the opportunity to embark on my Masters and for completing this long and challenging journey successfully. I would like to express my appreciation and gratitude to my research main supervisor, Professor Dr Osman bin Che Bakar for the endlessly supervision, guidance and suggestions and also co-supervisors, Professor Dr Ainsah binti Omar for the support, guidance and assistance towards completion of this research.

I wish to extend my appreciation to Associate Professor Dr Hatim bin Sulaiman, Head of Department of Psychiatric Daycare Clinic University Malaya Medical Centre (UMMC), Dr Zulkifli bin Ghaus, Head of Department of Mental and Psychiatric Clinic of Hospital Sungai Buloh, Head of Staff Nurse at Blood Collection Centre (UMMC) and staffs in UMMC, psychiatrist and staffs in Sungai Buloh Hospital for their cooperation and continuous support.

Many thanks also to Dr Ikhsan bin Selamat, Public Health Specialist, for his statistical assistance, staffs and colleagues of Teknologi MARA, Sungai Buloh who had been very helpful to me throughout the period of the study.

I want to thank to Universiti Teknologi MARA for the financial support with Fundamental Research Grant Scheme (FRGS).

Finally, I also would like to thank my family and husband for their understanding and support throughout this research.
CHAPTER ONE
INTRODUCTION

1.1 RESEARCH BACKGROUND

1.1.1 Schizophrenia

In 1890, Emil Kraeplin, a German psychiatrist first recognized and described Schizophrenia as a group of illness characterized by catatonia and hebephrenia/disorganization that begun during adolescence and invariably lead to social deterioration. Kraeplin proposed that this illness was a brain disease, which he named the disease as dementia praecox and carried a poor prognosis. Later, Eugene Bleuler, a Swiss psychiatrist in 1911 worked on the concept of dementia praecox and further classified the symptoms of this illness based on a fundamental of 4A-s (Ambivalence, Autism, inappropriate/flatness of Affect or looseness of Association). Kurt Schneider in 1959 later identified more psychopathology and symptoms, which included the positive symptoms namely delusions and hallucinations. He further classified them into Schneiderian First Rank Symptoms of Schizophrenia. These symptoms/psychopathology were later incorporated into International Classification of Diseases (ICD) and Diagnostic and Statistical Manual (DSM) classifications of Schizophrenia.

Schizophrenia is a chronic major debilitating mental illness characterized by disturbances in effect, thought, emotion, mood and behaviour. It is associated with changes in personality, deterioration in function and intelligence, poor judgement and insight (Ainsah & Osman, 2013). According to World Health Organization (WHO), "Schizophrenia" is referred as a severe mental disorder, which is characterized by profound disruptions in thinking, affecting language, perception, and the sense of self. Schizophrenia can occur at any age from 7 to 70, but more prevalent in late adolescent or early adulthood and mostly in the age group of 13-35 years old. The prevalence of Schizophrenia is approximately 1% and affects more than 21 million people worldwide (WHO, 2014).
