ABSTRACT

This research project was conducted to identify the factors that affect the awareness level on Personal Financial Planning among newly employed graduates at Scope International (M) Sdn Bhd. The purpose of this research is to investigate the problems and suggest solutions from literature and study done on the topic because the awareness level of newly employed graduates on personal financial planning is said to be low especially for those who live in urban areas like Kuala Lumpur. The researcher does a literature review from past researchers that are related to this study. The literature review helps to describe, summarise, evaluate, clarify and/or integrate the content of primary reports. Furthermore, the data methodology then helps the researcher to interpret the data from the questionnaire that has been distributed to convenient respondents. The methods used are Reliability Statistic (Cronbach’s alpha), Frequencies (demographic statistics), Descriptive statistics, and Hypothesis Testing which consists of Pearson Correlation Matrix and t-Test for Differences between Two Groups. Conclusions and recommendations will come out after the data is analyzed.
