TECHNICAL REPORT

**ANALYSING THE EFFECTS OF DIFFERENT OPTIONS FOR
FUZZY RULE BASED TO DETERMINE THE GENERAL
ANAESTHESIA DOSAGE**

**NURULIZZAH BINTI AHMAD RAMLI @ NAZELI –2017535061
NURUL NADIA BINTI KATNI –2017371817
ZULAIKHA BINTI TAHARUDDIN –2017947857
(P53/S19)**

**Report submitted in partial fulfillment of the requirement
for the degree of
Bachelor of Science (Hons.) (Management Mathematics)
Faculty of Computer and Mathematical Sciences**

DECEMBER 2019

ACKNOWLEDGEMENTS

IN THE NAME OF ALLAH, THE MOST GRACIOUS, THE MOST MERCIFUL.

Firstly, we are grateful to Allah S.W.T for giving us the strength to complete this project successfully.

We are really grateful because we managed to complete our report within the time given by our lecturer. This report cannot be completed without the effort and co-operation from our group members, Nurulizzah, Nurul Nadia, and Zulaikha.

The completion of this report could not have been possible without the participation and assistance of so many people whose name may not all be enumerated. Their contributions are sincerely appreciated and gratefully acknowledged. However, our group would like to express our deep appreciation and indebtedness particularly to our supervisor, Dr. Zati Aqmar Binti Zaharudin for her endless support, kind and understanding spirit during our case presentation. To all relatives, friends and others who in one way or another shared their support, either morally, financially and physically, thank you.

Above all, to the Great Almighty, the author of knowledge and wisdom, for the countless love.

We thank you.

ABSTRACT

Anesthesia is the process of inhaling or injecting drugs to create a deep unconscious state and block pain feeling which prevents all sensation. Currently, anesthetist estimates anesthetic dosage level required using medical method to produce induction in general anesthesia. The anesthetist gives more attention only to the Bispectral Index (BIS) rather than observe the raw electroencephalogram (EEG). The raw EEG data is more difficult to interpret since it has complex data which can cause problem of under dosing and overdosing. The impact of under dosing and overdosing will delay the progress of patients to be under anesthetized state. This paper proposes a fuzzy model for deciding anesthetic dose based on patient's data (age, height and weight). The drug dose computed by defining IF-THEN rules between three different options which are Option 1 (age and body surface area (BSA)), Option 2 (age, height and weight) and Option 3 (age and body mass index (BMI)). The objectives of this study are to calculate the anesthetic dosage level by implementing three sets of different options which are: Option 1 (age and BSA), Option 2 (age, height and weight) and Option 3 (age and BMI) by using fuzzy rule-based method, to compare the new calculated anesthetic dosage level with the existing study (input: BSA and age) and the actual dose, and to compare the best options of the new calculated anesthetic dosage level with the existing study by measuring the average of percentage absolute error. The best option with the minimum average of percentage absolute error of new calculated anaesthetic dosage level is Option 1 but the existing study (Kumar et.al, 2006) has the smallest average percentage of absolute error of calculated anaesthetic dosage level.

TABLE OF CONTENT	iii
LIST OF TABLES.....	v
LIST OF FIGURES.....	v
TERMS OF ABBREVIATION.....	vi
CHAPTER 1: INTRODUCTION	1
1.1 Introduction.....	1
1.2 Background of Study.....	2
1.3 Problem statement	4
1.4 Research Questions	5
1.5 Research Objectives	5
1.6 Scope and Limitation of Study	5
1.7 Significance of Study	6
1.8 Outline of the Report.....	6
1.9 Summary	6
CHAPTER 2: LITERATURE REVIEW.....	7
2.1 Introduction.....	7
2.2 General Anesthesia.....	7
2.3 Drug Dose Calculation in General Anesthesia.....	8
2.3.1 Fuzzy Ruled Based Methods	8
2.3.2 Medical Method	9
2.4 Inputs of Fuzzy Rule Based.....	10
2.4.1 Age	10
2.4.2 Body Surface Area	10
2.4.3 Body Measurement Index (BMI).....	11
CHAPTER 3: METHODOLOGY	12
3.1 Research Methods	12
3.2 Research Activities	13
Phase 1: Determination of the inputs of each option for Fuzzy Rule Based.....	14
Phase 2: Determination of the membership functions for Fuzzy Rule Based.....	14
Phase 3: Implementation of the inputs and membership function in Fuzzy Rule Based	18
Phase 4: Comparing the result with referred existing study and the actual data.....	18

Phase 5: Analyzing the percentage of absolute error for each option.....	19
Phase 6: Compare the best option of the calculated anesthetic dosage level with the existing study	19
3.3 Data Collection Method	20
3.4 Summary	20
CHAPTER 4: FINDING AND DISCUSSION	21
4.1 Calculation of Anesthetic Dosage Level of Option 2 and Option 3.....	21
4.2 Comparison of Calculated Anesthetic Dosage Level between Existing Study and the Actual Dose.	25
4.3 Absolute Error of Options and Existing Study.....	27
4.4 Summary of Result.....	29
CHAPTER 5: CONCLUSION AND RECOMMENDATION	30
5.1 Summary	30
5.2 Accomplishment According to the Research Objective.....	30
5.3 Significant of Finding	31
5.4 Recommendation	31
