Thesis Title: The Actuarial Implications of Increasing the Compulsory Retirement Age on the Government Pension Scheme in Malaysia

Signature of Candidate:
Date: 16/11/09
ABSTRACT

Many researches on life expectancy have been done, and for most countries it is shown to be increasing. Since the life expectancy at a particular age tends to increase over time for male and female, the mortality risk tends to be lighter over time. Therefore it is expected that pensioners will live longer and thereby cause an increase in pension liabilities to the government. Many countries are now facing a problem of an increase in pension costs, and are looking for solutions to this problem. The most common solutions used are to equalize the retirement age for male and female and to raise the retirement age up to 65 years old.

On 1st October 2001, the Malaysia government had extended the compulsory retirement age from 55 to 56 years old with an option to retire earlier. And up to date, the Malaysia government had again extended the compulsory retirement age to 58 years old with an option to retire earlier, which was enforced from 1st July 2008.

The main objective of the study is to investigate empirically the actuarial implications in the long term and in the year to year to the government as the compulsory retirement age increases from 55 to 60 years with an option to retire earlier in phases of one year. In order to investigate empirically the actuarial implications in the long term, the capitalised future lifetime costs (or pension liabilities to the government) were estimated as the age of compulsory retirement increases. And to investigate empirically the actuarial implications in the year to year, the actuarial cash flow of annual pensions as the age of compulsory retirement increases until year 2030 were studied.

After all the analysis has been made, we concluded that the compulsory retirement age should be increased in the future in order to decrease the government liabilities as the number of pensioner entering the pension scheme is increasing every year and as the life expectancy of Malaysian population increased year by year.
Acknowledgements

I would like to express my deepest appreciation to my supervisor, Dr. Fauziah Hanim Tafri and Associate Prof. Azizah Murad for their guidance, patience, encouragement and constructive criticism throughout this PhD program which has contributed to the completion of this thesis. I would also like to thank Assoc. Prof. Dr. Shahrir Hussin, Prof. Dato’ Dr. Mohamad Ali Hassan, Prof. Halim and Assoc. Prof. Dr. Hamidah Maidinshah for their valuable help and suggestions.

I am most grateful to University of Malaya for giving me the opportunity to fulfill my ambition.

My heartfelt appreciation goes to my husband Zailan who has not only provided endless encouragement during the project but also tangibly contributed to making this a success by helping me with the data-entry and computer programming. I would also like to thank my parents for their support, motivation and prayers for my success. Last but not least, I thank the examiners Prof. Dato’ Dr. Mohd. Azmi Omar, Assoc. Prof. Dr. Izani Ibrahim and Dr. Haslifah Hashim for their valuable comments and suggestions.
