

**Properties of Amorphous Carbon Thin Films for  
Solar Cell Application**

This thesis is presented in partial fulfillment for the award of the  
Bachelor of Electrical Engineering (Hons.)  
**UNIVERSITI TEKNOLOGI MARA**

**NORHAFIZAN BINTI MOHD HANIB  
FACULTY OF ELECTRICAL ENGINEERING  
UNIVERSITI TEKNOLOGI MARA  
40450 SHAH ALAM SELANGOR,  
MALAYSIA**

## **ACKNOWLEDGEMENT**

The author would like to thank Assoc. Prof. Dr. Mohamad Rusop as a supervisor and Mr Uzer Mohd Noor as a co-supervisor for useful suggestion, guidance and discussion to ensure this project are successfully completed. The author is thankful to Institute of Science, UiTM for providing equipments and materials for this research.

The author would like to take this opportunity to express her appreciate to her family and friends for give a lot of support until finish her study. May Allah bless them all and thank you so much for their support.

## ABSTRACT

This thesis is presented the research on properties of amorphous carbon (a-C) thin films for solar cell application. Amorphous carbon thin films have been deposited on silicon substrate by thermal chemical vapor deposition (Thermal-CVD) method at various deposition temperatures. The surface morphology and electrical properties of these films have been studied using Scanning Electron Microscope (SEM) and Current Voltage (I-V) Measurement (Advantest R6243 DC Voltage Current Source/Monitor Software), respectively. It was found that increasing deposition temperature had the most influence on the a-C thin films properties. In addition the carrier gas flow and catalyst concentration both showed a secondary impact on the properties of a-C thin films. The resistivity of a-C thin films decreases when the deposition temperature increases. However, at higher deposition temperature the conductivity increases due to the formation of more disorder  $sp^2$  carbon site.

# CHAPTER 1

## INTRODUCTION

### 1.1 Introduction

Amorphous carbon (a-C) thin films have been made by a variety of techniques such as thermal chemical vapor deposition (thermal CVD), electron gun evaporation, sputter deposition, cathodic arc deposition and pulsed laser deposition [1]. Among the different methods for the preparation of a-C thin films, thermal CVD method has many advantages such as an economical in production, since many parts can be deposited at the same time.

Recently, a-C thin films are use as an alternative material in solar cell application to replace the dominant material which is silicon. Carbon has many advantages compare to silicon such as high thermal conductivity, high electrical resistivity, high dielectric strength and high hardness [2]. These properties are suitable for solar cell application. Unfortunately, the efficiency of a-C thin films is lower comparing to silicon for solar cell application. However, by focusing of cost per performance, a-C thin films more efficient compared to silicon.
