ACKNOWLEDGEMENTS

IN THE NAME OF ALLAH, THE MOST GRACIOUS, THE MOST BENEFICIENT, THE MOST MERCIFUL.

All praises to Allah for the health and vigor that have made us able to complete this project until the end.

We are highly thankful to our supervisor Pn. Wan Khairiyah Hulaini Binti Wan Ramli for her active guidance, understanding, full support and encouragement throughout the completion of our project.

We would like to thank all of our fellows from CS249, that helped us throughout this academic exploration. Also a special thanks to those whom had kindly lend their hands whether indirect or direct. We would like to place on record, our sense of gratitude to our families, without them we would not have a chance to be here, today.

Last but not least, we would like to extend our appreciation to those who could not be mentioned here but well played their role to inspire the curtain.

ABSTRACT

The title of this project is d'Alembert Formula For Wave Equation. The purpose of this project is to solve the wave equation problem by using d'Alembert formula and show that the wave is traveling towards opposite directions. First, d'Alembert formula is derived from the wave equation. Then, a few wave problems have been chosen and solved. Various graphs have been plotted by using Maple Software, which show that it is proven the wave is traveling towards two opposite directions. After all of the three steps of methodology have been done, the results achieved is as wanted. The results have shown that the d'Alembert formula can be used to solve wave equation problems. This formula also can be used to prove that the wave is travelling in two opposite directions.

1 INTRODUCTION

1.1 Introduction

In physics, the description of waves such as light waves, water waves and sound waves which is an important second-order linear partial differential equation can be described by the wave equation.

Historically, Jean le Rond d'Alembert, Daniel Bernoulli, Joseph-Louis Lagrange and Leonhard Euler have been investigated about the problem of a vibrating string (Cannon et al., 1983). D'Alembert had found the one-dimensional wave equation in 1746 and after ten years, Euler found the three-dimensional wave equation (Spesier, 2008).

This project involves one-dimensional wave equation which the standing wave is produced from two waves with the same amplitude, wavelength, and frequency travel in opposite directions.

The wave equation for u is

$$u_{tt} = a^2 u_{xx} \quad (1)$$

where a^2 is a fixed constant.

The solutions of the equations describe the propagation of disturbances out of the region at fixed speed. The constant a^2 is denoted as the propagation speed of wave. It is a linear equation. The superposition principle which is the solutions is again a solution or the sum of any two functions is thus applied in this project.
