Dissertation submitted in partial fulfillment of the requirements  
for the degree of  
Bachelor of Pharmacy (Hons.)

2013

## **ACKNOWLEDGEMENTS**

All commendations to Almighty Allah, who imparted me resoluteness and fortitude for accomplishment of this work successfully.

I would like to express my deep gratitude to my supervisor, Dr. Salfarina Ramli for all her thought, guidance, encouragement and invaluable help given to me in completing this research.

I also appreciate the help from laboratory assistants and post-graduate students in doing my lab work, handling equipment and their willingness in sharing their knowledge with me.

I am indebted to my family members whose endless prayers and continuous moral support enabled me to get through the period of my academic journey. Special thank to my research partners, Syazwan and Fatin Nabila and for their support and cooperation during my project research.

## ABSTRACT

The study was done to determine the antibacterial effect of flavonoids and petroleum ether extract of *Hibiscus rosa-sinensis* leaves in *Staphylococcus aureus* (*S. aureus*), methicillin-resistant *Staphylococcus aureus* (MRSA), *Streptococcus agalactiae* (*S. agalactiae*), *Streptococcus pyogenes* (*S. pyogenes*), *Pseudomonas aeruginosa* (*P. aeruginosa*), *Escherichia coli* (*E. coli*), *Klebsiella pneumonia* (*K. pneumonia*) and *Shigella* spp. Evaluation of antibacterial activity was carried out using broth microdilution assay. MTT assay was used to determine the minimum inhibitory concentration (MIC). The results showed the MIC values of rutin were 10 mg/ml against *S. aureus* and *K. pneumonia* and 1mg/ml against *S. agalactiae* and *S. pyogenes*. The MIC values of naringenin were 1 mg/ml and 0.05 mg/ml against *S. agalactiae* and *S. pyogenes* respectively. The MIC value of kaempferol, taxifolin and myricetin against *S. pyogenes* was 0.05 mg/ml. The MIC value of petroleum ether extract of *Hibiscus rosa-sinensis* leaves against *S. aureus* was 5 mg/ml. There were no MIC values determined in MRSA, *P. aeruginosa*, *E. coli* and *Shigella* spp in both of flavonoids and petroleum ether extract of *Hibiscus rosa-sinensis* leaves. This study showed positive effect of flavonoids; rutin, naringenin, kaempferol, taxifolin and myricetin and petroleum ether extract of *Hibiscus rosa-sinensis* leaves as antibacterial properties.

# CHAPTER ONE

## INTRODUCTION

### 1.1 Introduction

Nature has been the source of medicine since thousands years ago. Apparently, the secondary metabolites which serve as defense agents against invading microorganisms (Arullappan, Zakaria, & Basri, 2009) have been recognized as contributing to the antimicrobial property of plant extract (R. Nair, Sumitra Chanda, & T.Kalariya, 2005). As a result over 50% of all modern clinical drugs are of natural product origin (R. Nair *et al.*, 2005). Generally, practice in oriental medicine utilizes a number of plants. The mixture of several crude extracts increases the medicinal effects through synergistic amplification and diminishes any possible adverse effects (Mishra, Tandon, & Munjal, 2009). Therefore, the concept of a whole or partially purified extract of a plant gives advantage over a single isolated ingredient (Mishra *et al.*, 2009). Currently, studies on the biological activity of plants are increasing due to the awareness of adverse effects exhibited by synthetic pharmaceutical products (R. Nair *et al.*, 2005). Such studies contribute to the pharmacological basis of medicinal plants.
