ACKNOWLEDGEMENTS

Alhamdulillah, all praise to Allah S.W.T with the greatest mercy, blessings and hidayah from Him that I can finally complete my study in bachelor degree level with peace and calm.

I would like to take this opportunity to say thank you very much to my lovely advisor which is Associate Professor Dr. Imbarine bin Bujang for his guidance, monitoring and consultation throughout this study. Infinite efforts, time, energy and support that he had given to me while conducting this study was very priceless and meaningful to me as he plays a very important role in the success of this research. For me, he is not just a lecturer and advisor, but also a friend that understands me very well.

I am also grateful for having a great second advisor which is Madam Siti Rahayu binti Beli, the lecturer of Business Management faculty for her uncountless support, guidance, and also precious information related to this study which also helped me in completing this thesis. A token of appreciation also addressed to Dr. Abdul Aziz Karia for his guidance and information which help me a lot in understanding the methods used in this study.

I am also blessed for having a massive support and guidance from my family members and also my classmates that never stop encouraging me in achieving the most valuable and unforgettable moments in my life. All of your cooperation is much appreciated.

Thank you.

3.9	Theoretical framework	42
3.9.1	Dependent variable	43
3.9.2	Independent variables	43
3.10	Software used in this study	43-44
3.11	Research methodology flow	45

ABSTRACT

This study is conducted to describe the influence of fundamental factors and weather conditions in Malaysia towards the sectorial index returns. For the purpose of this study, the performance of three sectors in Malaysia which are construction, plantation and trade & service sectors is being observed starting from January 1, 2017 until December 31, 2017. By using the fundamental factors which are beta (β) and also the market capitalization of three sectors including five main weather conditions in Malaysia which comprises of sunny, rainy, cloudy, windy and thunderstorm as the independent variables to determine whether there is significant relationship towards the sectorial index returns as the dependent variable in this research. Multiple Regression Model is being used to test the relationship between independent and dependent variables. The findings reveals that there is significant relationship between the trade & service sector towards the fundamental factors and also the weather conditions in Malaysia as compared to other sectors.

Keywords: *Fundamental Factors, Weather Conditions, Sectorial Index Returns, Multiple Regression Model*
