Final Project Submitted in Partial Fulfillment for the Diploma in Wood Industry, Faculty of Applied Science, Universiti Teknologi MARA Pahang

APRIL 2010

ACKNOWLEDGEMENT

بسمأللهألرحين

In the name of Allah, The most Gracious and The Most Merciful

First and foremost, our highest gratitude to Allah S.W.T for the strength and endurance given to us in the completion of the project. Without his blessing given to us our final project paper under the title properties of particleboard from *Leucaena leucocephala* and effect of mixing ratio with fast growing species would not have been successfully.

Our sincere gratitude and thanks to our advisor, Dr Wan Nazri Bin Wan Abd. Rahman for his supports and advices from the beginning until the end of our research. Without his guidance we would not be able to complete our project paper. We also love to say thank to our entire lecturer for their support and advises until this project is a success.

Thank you to all wood Industry staff, especially En.Sardey because they have a lot of effort time to guidance us in order to complete our thesis. Last but not least we would like to thank all our friends and our families which give us motivation and always support us. Thank you.

ABSTRACT

PROPERTIES OF PARTICLEBOARD FROM Leucaena leucocephala AND EFFECT OF MIXING RATIO WITH FAST GROWING SPECIES

By

M RAFAIS BIN M RAZIP MOHD AMIRURRAHMAT BIN MOHD ZAIN KHAIRUL AZELAN BIN KAPLI

April 2010

The properties of particleboard produced from *Leucaena leucocephala* and effect of mixing ratio with fast growing species using urea formaldehyde were studied. The influences of mixing particle sizes (0.5mm and 1.0mm), resin content (9%) and target board density (700 kg/m³) were studied. The particleboard was tested for the physical and mechanical properties using the European standard. The effect of mixing different fast growing species with *Leucaena leucocephala* will produced a new wood product with new properties. When two or more species mixed together, the mechanical properties of board became weaker than one species board. To overcome this weakness, more wax must be added.
