## ACKNOWLEDGEMENT

First of all, we feel grateful to ALLAH S.W.T for blessing us until had been successfully completed and submitted our final year project entitled 'the distribution of Dipterocarpus species in UiTM Jengka forest reserve. During this semester, we had many challenge to suffer. There were many problems came to us. Sometimes, we can solve it by our group, but sometimes it feels so hard. We would also like to express our deepest appreciation to our advisor, En. Nik Hazlan bin Nik Hashim for encouragement and guidance in designing and implementing this project until the end of our study.

All the lectures of diploma in wood industry especially for our advisor lecturer En.Wan Nazri Bin Wan Abdul Rahman as a lecturer WTE 375 (final year project) for his help, support and guidance throughout the cause of our study. Thanks also dedicated to those who would involved directly or indirectly in the completion of this study. He also always is patient to teach us along the way to finish our project. Thanks a lot.

We are also grateful because all the resources centre namely librarian at UiTM Jengka for helping us in some information about the thesis and book resources that related with our thesis. *Thanks for all my friends that gave our group support. Without their support, we can't finish this report on my group.*

We had doing all my best to finish this report, so we hope, we will get good result because this report can improve our GPA and CGPA. We really appreciate it.

Thank you very much.

**ABSTRACT**

This study is conducted in UiTM Jengka Forest Reserve at Base Line: line 11-20. the main objective of this study are to determine the distribution of Keruing Merah (*Dipterocarpus verrucosus*), Keruing Gombang (*Dipterocarpus cornutus*), Keruing Mempelass (*Dipterocarpus crinitus*), and Keruing Kipas (*Dipterocarpus costulatus*). We use inventory method where we measured 10 meters (5m right and left) and its length 575 meter (line 11-20). It means the forest areas that we studied for line 11-20 are 10m×575m. From our study we were found 29 for Keruing Merah, 2 for Keruing Gombang, 13 for Keruing Mempelass, and 5 for Keruing Kipas. Keruing Merah is the most found in the UiTM JFR because easily growth in lowland and exposed to sunlight. From this area there had found 49 number of individual.
