**Drama Recommender System Using Collaborative
Filtering**

MUHAMMAD HAZIQ ZARRIN BIN JOHAR

BACHELOR OF COMPUTER SCIENCE (HONS.)

Jan 2025

ACKNOWLEDGEMENT

Alhamdulillah, all praises and gratitude are due to Allah S.W.T for His boundless blessings and grace, which enabled me to complete this research within the stipulated timeframe. Firstly, I would like to extend my heartfelt appreciation to my CSP650 lecturer which is also my supervisor, Madam Ummu Fatimah binti Mohd Bahrin, for her invaluable guidance and support throughout this project. Additionally, I am deeply grateful to my supervisor, whose unwavering supervision and assistance have been instrumental in the successful completion of this research. Without their continuous support and direction, this achievement would not have been possible.

I would never have achieved this if they did not continuously support me and direct me to do the right thing. I would also love to give my heartfelt thanks to my lovely parents for the unending support, encouragement, and unrelenting prayers that have contributed to a rough sail in my research. Their sacrifices, faith, and sacrifices in sacrificing their work for the sake of supporting me have been the locomotion that drives me, burning edges every day.

Finally, I want to express sincere gratitude to my dearest friends who have formed a strong bond of partnership throughout the study. Without their encouragement and continued assistance, it is likely that I did not achieve my study in time. Gratitude to each individual who is not mentioned here who lives where I get help, assistance and motivation for research.

ABSTRACT

This thesis focused on developing a Drama Recommender System using collaborative filtering techniques to help users find dramas that match their preferences. The motivation behind this project was to address the challenge users face in selecting dramas from an overwhelming number of options. The system analyzes user preferences and viewing behavior to generate personalized recommendations, enhancing the drama-watching experience. The methodology followed a structured approach, beginning with a preliminary phase that involved conducting a literature review on recommendation systems and collecting a dataset from sources such as Kaggle. The dataset consisted of drama metadata. Data cleaning was performed to handle missing values, remove duplicates, and standardize formats, ensuring consistency and accuracy. In the system design and feature extraction phase, the architecture was developed to support efficient data processing and recommendation generation. TF-IDF (Term Frequency-Inverse Document Frequency) was applied to extract relevant textual features from drama descriptions, while cosine similarity was used to measure relationships between dramas. The implementation and evaluation phase involved developing the recommender system using Python, Pandas, NumPy, and Scikit-learn. The system's performance was assessed using accuracy, precision, recall, and F1-score, achieving values of 0.77, 0.85, 0.89, and 0.87, respectively. These results demonstrate that the system effectively provided high-quality and relevant recommendations, improving user satisfaction and helping users discover lesser-known dramas. To further enhance recommendation quality, content-based filtering was incorporated to analyze drama attributes such as genres, actors, and directors, ensuring a more diverse range of suggestions. Future improvements include integrating trend-based recommendations, personalized watchlists, and interactive user feedback to refine the recommendation process and enhance user engagement. By continuously refining the system with advanced techniques and incorporating user feedback, the Drama Recommender System can evolve into a highly adaptive and intelligent platform, delivering even more relevant, diverse, and satisfying recommendations to users.
