ABSTRACT

OPTIMIZATION OF COMPRESSION PARAMETERS IN PELLETIZATION OF EMPTY FRUIT BRUNCH (EFB) AND HIGH-DENSITY POLYETHYLENE (HDPE) CHAR FOR ENHANCED SOLID FUEL APPLICATIONS

This paper investigates the optimization of pelletization parameters for char waste derived from the co-pyrolysis of Empty Fruit Bunches (EFB) and High-Density Polyethylene (HDPE) to produce durable and energy-efficient fuel pellets. The research focused on varying the HDPE content at 0, 25, 50 and 75% and compression pressure at 100, 200 and 300 MPa using a One-Factor-At-a-Time (OFAT). Using a One-Factor-At-a-Time (OFAT) approach, the physical properties like density and mechanical durability were evaluated. The optimum condition was found at 75% of the HDPE content and at 300 MPa, yielding pellets with a high density of 1150.2 kg/m³ and mechanical durability of 99.71%. Combustion performance of the optimized pellet was assessed through proximate analysis and higher heating value (HHV) analysis. It revealed a low in moisture content (0.89%), low in ash content (0.86%) but high in volatile matter (98.09). Furthermore, fixed carbon content of just 0.16% indicates that the fuel's ability to maintain long burning performance is limited. This is reflected in the moderate higher heating value (HHV) of 15.34 MJ/kg, which, while usable, it falls short compared to other biomass-based fuels that typically exhibit HHVs ranging from 18 to 25 MJ/kg (Anshariah et al., 2020). The suitable potential applications for this pellet is in gasification or as lightweight fillers rather than direct solid fuel. Therefore, the limitation in fixed carbon and moderate energy yield suggest further study focusing to improve this parameter such as perhaps through feedstock selection or thermal treatment to enhance the fuel's overall performance. Overall, the study demonstrate the feasibility of converting EFB and plastic (HDPE) waste into valuable energy products such as pellets, contributing to waste valorization and sustainable fuel development.

TABLE OF CONTENTS

	Page
ABSTRACT	iii
ABSTRAK	iv
ACKNOWLEDGEMENT	v
TABLE OF CONTENTS	vi
LIST OF TABLES	viii
LIST OF FIGURES	ix
LIST OF SYMBOLS	x
LIST OF ABBREVIATIONS	xi
 CHAPTER 1 INTRODUCTION	 1
1.1 Research Background	1
1.2 Problem statement	4
1.3 Research Questions	5
1.4 Objectives	6
1.5 Significance of Study	6
1.6 Expected Outcomes	7
 CHAPTER 2 LITERATURE REVIEW	 8
2.1 Solid char derived from co-pyrolysis of EFB and HDPE	8
2.2 Pelletization process of solid char waste	8
2.3 Influence of varying compression pressure on the density of the pellet	9
2.4 Influence of varying compression pressure on mechanical durability of the pellets	11
2.5 Combustion properties of pellets through proximate analysis	12
2.5.1 Moisture content of the solid pellets	12
2.5.2 Volatile matter, ash content and fixed carbon of the solid pellets	14
2.6 Higher Heating Value analysis (HHV)	15
 CHAPTER 3 METHODOLOGY	 17
3.1 Materials, apparatus and equipment	17
3.2 Material preparation for co-pyrolysis	17
3.3 Co-pyrolysis of EFB-HDPE in a Fixed Bed Reactor	18
3.4 Sample preparation of solid char	18
3.5 Pelletization process	19
3.6 Design of Experiment	20
3.7 Characterization of pellets (physical properties)	21
3.8 Combustion properties through proximate and HHV analysis	22

CHAPTER 4 RESULTS AND DISCUSSION	24
4.1 Yield of solid char with varying percentage of HDPE added	24
4.2 Physical properties of the char pellet	26
4.2.1 Density of the pellet	27
4.2.2 Mechanical durability of a char pellet	29
4.2.3 Interaction effects and trends of the factors on the pellet	31
4.3 Combustion properties of optimized HDPE-ECF char pellets	32
4.3.1 Proximate analysis	32
4.3.2 Higher Heating Value (HHV)	33
4.4 Analysis of combustion properties and application feasibility of char pellet	34
4.4.1 Pure ECF	35
4.4.2 ECF:HDPE (75:25)	36
4.4.3 ECF:HDPE (50:50)	37
4.4.4 ECF:HDPE (25:75)	37
 CHAPTER 5 CONCLUSION AND RECOMMENDATIONS	 39
 REFERENCES	 41
APPENDICES	46
CURRICULUM VITAE	47
