**THE EFFECTS OF *EURYCOMA LONGIFOLIA* AND
POLYATHIA BULLATA ON ENZYME CYP17A1
EXPRESSION AND ANDROSTENEDIONE LEVELS IN
MALE SPRAGUE-DAWLEY RATS**

MUHAMMAD FIQRI BIN ZOLKURNIAN

Dissertation submitted in partial fulfilment of the requirements for the Bachelor of
Pharmacy (Hons.)

Faculty of Pharmacy

2017

ABSTRACT

Eurycoma longifolia (Simaroubaceae family), famously known as “Tongkat Ali” in Malaysia, is a popular traditional remedy to improve male sexual libido, sexual dysfunction, power tonic and male idiopathic infertility. *Polyalthia bullata* (Annonaceae family), also known as “Tongkat Ali Hitam” by the local, is a plant that is known traditionally due to its aphrodisiac properties. This study is about the effects of both plants on the morphometric changes, enzyme CYP17A1 expression and the androstenedione level in healthy male Sprague-Dawley rats. 24 male rats were divided into control group, *E. longifolia* group, and *P. bullata* group with 8 rats in each group respectively. Both treatment groups were given dose of 800 mg/kg body weight of both plants that were orally administered daily for 14 days. The control group was given distilled water. The gene expression of enzyme CYP17A1 was carried out by Real-time PCR and the fold change value was calculated using the 2^{-ddct} method. The androstenedione level was determined by using the enzyme-linked immunosorbent assay (ELISA) method using the blood serum from the rats. The morphometric study showed that *P. bullata* significantly ($p < 0.05$) decreases the body weight of the rats, while the reproductive organs weight showed no significant difference between the groups. Androstenedione level of the rats showed a significant ($p < 0.05$) decrease in group treated with *P. bullata* when compared to control group. Gene expression of CYP17A1 enzyme showed a trend of upregulation up to 5-folds and 0.8-fold for *E. longifolia* and *P. bullata* treated group. However, this data is not significant ($p > 0.05$). Therefore, the above study provides information on the effects of *E. longifolia* and *P. bullata* regarding the aphrodisiac properties of both plants based on the morphometric changes, enzyme CYP17A1 expression and androstenedione level.

ACKNOWLEDGEMENT

Alhamdulillah, praise be to Allah SWT for the good health and wellbeing that were necessary to complete this study.

The completion of this undertaking could not have been possible without the participation and assistance of so many people. I owe my deepest gratitude to those involved in helping me throughout my journey on completing this final year project.

Special thanks to my team members as well, Muhammad Bin Samsusah, Umair Alhadi Bin Mohd Sahri and Nur Adilah Binti A.Rahman who helped and guided me throughout the course of the experiment.

I am very grateful to my supervisor who is also the final year project coordinator of Faculty of Pharmacy, Dr. Gurmeet Kaur Surindar Singh whose patience and passion guided me upon completing this project. My appreciation also goes to the guidance of my co-supervisor, Dr Mashani Mohamad especially in the gene expression experiment with her supervision and direction.

I am also blessed to have a supporting family, Zolkurnian Hassan,

Muhd Afiq and my friends who are always there to support me and provide strength for me to complete this project. Not to forget my housemates who endlessly help to cheer me up when things are not going so well and convince me that I would be able to go through all of it.

I would like to thank Faculty of Pharmacy UiTM for providing me the financial support and all laboratory staff especially from the Brain Research Laboratory.

CHAPTER 1: INTRODUCTION

Aphrodisiac is an agent that has the ability to enhance sexual libido or sexual desire either through performance or the sexual organs itself (Krychman, Gubili, Pereira, Holstein, & Cassileth, 2007). It is marketed in variety of products or form including beverages, food, vitamins, minerals and synthetic substances. The possibility of bioactive aphrodisiacs which may be derived from plants, animals or minerals, has attract many interest throughout the recorded history (Taur & Patil, 2011).

Aphrodisiac plants had been widely used traditionally and had been passed down from generation to generation. A total of four species are being referred by locals with the name Tongkat Ali which are *Eurycoma longifolia*, *Entomophthora apiculata*, *Polyalthia bullata* and *Goniothalamus sp.* Among them, *E. longifolia* is known to be the most widely used species among the locals (Athimulam, Kumaresan, Foo, Sarmidi, & Aziz, 2006). *E. longifolia* contains multiple classes of biologically active compounds such as quassinoids group which are β -carboline alkaloids, canthin-6-one alkaloids, triterpene-type tirucallane, squalene derivatives and bioactive steroids. There are also active compound eurycolactone, eurycomalactone, laurycolactone and biphenyl neolignan found in the plant (Rehman, Choe, & Yoo, 2016).
