SUBMISSION FOR EVALUATION FINAL YEAR PROJECT 2 - RESEARCH PROJECT

BIONANOCOMPOSITE FILM BASED ON POLYSACCHARIDES FROM
MUSA ACUMINATA PEELS

Name : NOR ALISA NADHIRAH BINTI MOHD KHIRI
Student ID : 2022819214
Program : BACHELOR OF SCIENCE (HONS) CHEMISTRY WITH
MANAGEMENT
Course code : AS222
Mobile Phone :
E-mail : 2022819214@student.uitm.edu.my

** Please attach the first page of your original report, with your name clearly stated, at the end of your report and submit it together.*

Approval by Main Supervisor :

I certify that the work conducted by the above student is completed and approve this research proposal report to be submitted for evaluation.

Supervisor's name : PUAN WAHIDA BINTI ABDUL RAHMAN
Date : 15/2/2026
Turnitin Similarity : 9%
Signature :

ABSTRACT

BIONANOCOMPOSITE FILM BASED ON POLYSACCHARIDES FROM *MUSA ACUMINATA* PEELS

The growing environmental worries over petroleum-based plastic packaging, combined with the growing amount of agricultural waste, has increased the demand for sustainable and biodegradable materials made from renewable biomass resources. This research focused on the use of *Musa Acuminata* (banana) peel waste as a low-cost and ecologically beneficial raw material for the creation of biodegradable bionanocomposite films, thereby contributing to waste reduction and circular bioeconomy practices. Pectin and cellulose nanocrystals (CNC) were extracted from banana peel via acid-assisted chemical treatment and hydrolysis processes, yielding 6.02% pectin (3.0089 g from 50 g dried peel) and 7.74% CNC (3.8684 g from 50 g dried peel), demonstrating the technical feasibility of converting agro-waste into value-added functional biopolymers. The solvent casting process was used to create three different film formulations: 100% pectin film, 50:50 pectin–CNC composite film, and 100% CNC film. To improve the integrity and durability of the films, glycerol was used as a plasticizer and calcium chloride as a crosslinking agent. The Fourier Transform Infrared (FTIR) spectroscopy, Scanning Electron Microscopy (SEM), Optical Microscopy (OM) and Tensile Testing have been employed on all retrieved materials and produced sheets. The FTIR spectrum provides proof of the presence of any polysaccharides' functional groups that may have been deformed or lost from the physical structure during extraction or composite processing, both of which confirm that no structural changes have occurred to the polymer backbone of the polysaccharides. Morphological examination demonstrated that the pectin–CNC composite film has a consistent and flat surface that provides evidence of a high degree of interfacial interaction between the polymer matrix and reinforcing filler, as well as the good dispersion of CNC throughout the film. In comparison to neat pectin film (1.11 ± 0.37 MPa) and pure CNC film (0.95 ± 0.36 MPa), mechanical testing revealed that the 50:50 pectin and CNC composite film had the highest tensile strength (1.21 ± 0.23 MPa). The increased elastic modulus showed improved stiffness from CNC reinforcement. Overall, these findings indicate that CNC and pectin from banana peels can be used to create biodegradable bionanocomposite films with better mechanical performance and structural integrity. This offers a sustainable alternative to traditional plastic packaging and promotes resource efficiency, waste recycling, and the creation of eco-friendly materials.

TABLE OF CONTENTS

ABSTRACT	ii
ABSTRAK	iii
ACKNOWLEDGEMENT	iv
TABLE OF CONTENTS	v
LIST OF TABLES	viii
LIST OF FIGURES	ix
LIST OF SYMBOLS	xi
LIST OF ABBREVIATIONS	xii
CHAPTER 1 INTRODUCTION	
1.1 Background of Study	1
1.2 Problem Statement	4
1.3 Significance of the study	4
1.4 Objectives	5
1.5 Expected Output/ Outcomes/ Implication	6
CHAPTER 2 LITERATURE REVIEW	
2.1 Sustainable Materials in Packaging	7
2.1.1 Environmental impact of conventional plastic packaging	7
2.1.2 Global plastic waste and recycling challenges	8
2.1.3 Emerging Trends in Biodegradable Packaging Materials	9
2.2 Natural Polymers for Biodegradable Films	11
2.2.1 Polysaccharides as Biopolymer Sources	11
2.2.2 Advantages and Limitations of Natural Polymers in Packaging	12
2.2.3 Role of Biopolymers in Food Packaging Applications	14
2.3 Bionanocomposite Films	15
2.3.1 Definition and Classification of Bionanocomposites	15
2.3.2 Nanoparticles Used in Biopolymer Reinforcement	16
2.3.3 Mechanical, Thermal, and Barrier Property Enhancements by Nanoparticles	18
2.3.4 Fabrication Techniques for Bionanocomposite Films	19
2.4 Banana (<i>Musa Acuminata</i>) Peel as a Biomass Resource	21
2.4.1 Composition of Banana Peel: Polysaccharides and Other Components	21
2.5 Extraction and Characterization of Polysaccharides from Banana Peels	22
2.5.1 Methods of Pectin and CNC Extraction	22
2.5.2 Factors Affecting Yield and Quality of Extracted Pectin and CNCs	24
2.6 Characterization Techniques for Extracted Pectin and CNCs	25
2.6.1 FTIR Spectroscopy	25
2.6.2 Scanning Electron Microscopy (SEM) Characterization of Cellulose Nanocrystals	28
