Designing Visual Learning Tools to Improve Food Knowledge Among Children

This Final Year project aims to solve the issue of students, especially international and boarding students, having difficulty identifying unfamiliar food in the school cafeteria due to the absence of a clear and informative menu. The proposed solution is a digital cafeteria menu application or kiosk that displays food names, images, descriptions, ingredients, prices, and dietary information in a visually appealing and user-friendly format.

By providing better access to food information, the system helps students make informed meal choices, improves their dining experience, and creates a more convenient and inclusive cafeteria environment.
