ACKNOWLEDGEMENT

There are a number of people without whom this project might not have been written, and to I am greatly indebted.

I would like to express deepest gratitude to my supervisor, Sir Zairi Ismael Bin Rizman for his full support, expert guidance, understanding and encouragement throughout our study and research upon this project. Without his incredible patience and timely wisdom and counsel, our project would have been a frustrating and overwhelming pursuit.

Thanks also go to my fellow friends and staff in Electrical Engineering Department who helped us throughout this academic exploration.

Finally, I would like to thanks our parents for their unconditional love and support during the progress of finishing our final project. We would not have been able to complete our project without their continuous love and encouragement.

Thank you all.

ABSTRACT

This paper explains on the issues on the increasing of mice in agriculture area. Nowadays, farmers faced some problems on mice. This project is design to overcome the population of mouse in agriculture industrial. This electronic mousetrap is being improved as it can catch more than a mouse, with maximum of five mice. This product has a LCD to display a welcome message and message of mouse trapped. Then, the motor will rotate 90° clockwise when it detects motion and 90° anticlockwise when there is no motion. The material used in fabricating this mousetrap is PVC sheet, perspex, fastener such as screws and breadboard, door hinges, glue gun and door slot.
