Candidate's Declaration

I declare that the work in this thesis was carried out in accordance with the regulations of Universiti Teknologi MARA. It is original and is the result of my own work, unless otherwise indicated or acknowledged as referenced work. This thesis has not been submitted to any other academic institution or non-academic institution for any other degree or qualification.

In the event that my thesis be found to violate the conditions mentioned above, I voluntarily waive the right of conferment of my degree and agree to be subjected to the disciplinary rules and regulations of Universiti Teknologi MARA.

Name of Candidate	<u>Mohd Hafiz Musa</u>
Candidate's ID No.	<u>821010145309</u>
Programme	<u>Master of Science</u>
Faculty	<u>Applied Sciences</u>
Thesis Title	<u>Mechanical and Physical Properties of Hybrid Oil Palm-Rubberwood Engineered Veneer Lumber (HOPREV) for Furniture Components.</u>

Signature of Candidate

.....

Date

August 2011

ABSTRACT

The main objective of this study was to evaluate some of the mechanical and physical properties of Hybrid Oil Palm-Rubberwood Engineered Veneer Lumber (HOPREV). This study evaluated the affect of different binders (urea formaldehyde as control sample (HOPREV I) and polyethylene with fiber glass (HOPREV II)), hot press pressures (17.24 kg/cm^2 (1200psi) and 25.86 kg/cm^2 (1800psi)) and pressing times (10 and 20 minutes) on the HOPREV. In the mechanical test, bending, shear and screw withdrawal strength were determined. Thickness swelling, water absorption, delamination and density were investigated in the physical test. Based on the results tested, HOPREV II pressed at hot press pressure of 25.86 kg/cm^2 (1800psi) for 10 minutes showed the best mechanical and physical properties compared to the other test samples. Both HOPREV I and II showed improvement in mechanical and physical properties as the specific pressure increase. Mechanical and physical properties of HOPREV I also become better as pressing time was increased except for HOPREV II pressed for 10 minutes that showed better properties compared to HOPREV II pressed for 20 minutes. However, both HOPREV I and HOPREV II passed the standards BS EN 312-3: 1996, BS 5669: Part 1:1989 Section Three, BS EN 314-2:1993, BS EN 312-4: 1996 and JAS 233: 2003 for interior purposes in dry condition. HOPREV II performed better, but HOPREV I would be a better choice as it would be cheaper to produce. Therefore HOPREV I could be marketed at a more competitive price.

ACKNOWLEDGEMENTS

Alhamdulillah, praise be only to Allah S.W.T. for making this research and thesis possible to its completion.

My humblest gratitude goes to my main supervisor, Professor Madya Dr Mohd Ariff Jamaluddin who has been very kind and patient in guiding me. I highly value the knowledge and advice given throughout my time under his supervision. I would like to thank my co-supervisor, En Abdul Hamid Saleh, for his moral support and guidance. I also would like to thank En. Saimin Basir for tireless assist me to prepare and conduct sample testing

My absolute appreciation is also extended to the Forest Research Institute Malaysia (FRIM) and Malaysian Timber Industrial Board (MTIB) in sponsoring my study. Not to forget Kin Heng Timber Industries, Chemor, with their permission to use peeler and moulded hot press machines.

Not to forget my lovely wife Nor Haliyan Tan Shilan and daughter Hannah Karmila who gave me strength to accomplish this thesis. I am also blessed with having very dear friends who stood by me throughout my laboratory work and thesis writing. I would like to wish them triumph and success in all they endeavour. Lastly and foremost, I am in debt to both my beloved parents, for their constant support, motivation and encouragement to complete my research and thesis writing.
