Thesis submitted in fulfilment
Of the requirements for the bachelor of
Surveying Science and Geomatics (Honours)

JULY 2019

AUTHOR'S DECLARATION

I declare that the work on this thesis was carried out in accordance with the regulations of Universiti Teknologi MARA. It is original and the results of my own work, unless otherwise indicated or acknowledged as referenced work. This thesis has not been submitted to any other academic institution or non-academic institution for any degree or qualification.

I, hereby, acknowledge that I have been supplied with the Academic Rules and Regulations for Undergraduate, Universiti Teknologi MARA, regulating the conduct of my study and research.

Name of Student : Nur Fatin Amira Binti Zamri
Student I.D. No. : 2015646328
Programme : Bachelor of Surveying Science & Geomatics (Hons) –
AP220
Faculty : Architecture, Planning and Surveying
Thesis : Analyze Distribution Pattern and Relationship of Growth
Behavior of Dipterocarp Tree Species in FRIM

Signature of Student :

Date : July 2019

ABSTRACT

The Geographical Information System (GIS) has been used to analyze the pattern of distribution and behavioral growth of Dipterocarp species in Field 11 at the Forest Research Institute Malaysia (FRIM). Meranti Tembaga, Merawan Jangkang and Chengal are among one of Dipterocarp species found in FRIM and the study focuses on these three trees only. Issues that need to be resolved such as FRIM did not make detailed study of the plant and analyze the pattern of tree distribution have made this study done. The objective of this study is to investigate the distribution of existing Dipterocarp tree species based on the Diameter Breast Height (DBH), to classify the distribution pattern of trees based on Dipterocarp tree species and to study the relationship of Dipterocarp species growth behavior. The study has been through several processes such as design, data collection, geoprocessing, Hotspot analysis (Getis-Ord g_i^*) in mapping clusters, Spatial Autocorrelation (Moran I) in Spatial and Regression analyzing patterns to study Dipterocarp species growth behavior. GIS provides the advantage of collecting tree data from the database for mapping and extracting reports from analysis carried out in the study. Therefore, the latest data require a better improvement by FRIM to always be up-to-date. As a result, the study indicates the pattern of tree distribution, output of the map pattern and distribution from the report summary generated by analyzing the pattern and knowing the relationship of the main behavior to grow. So, GIS has assisted FRIM in maintaining and making conservation in managing Dipterocarp trees using the approach systematic.

TABLE OF CONTENT

CONFIRMATION BY PANEL OF EXAMINERS	II
AUTHOR'S DECLARATION	III
ABSTRACT	V
ACKNOWLEDGEMENT	VI
LIST OF TABLES	X
LIST OF FIGURES	XII
LIST OF ABBREVIATIONS	XIV
CHAPTER ONE: INTRODUCTION	1
1.1 Introduction	1
1.2 Research Background	1
1.3 Problem Statement	2
1.4 Research Aim and Objectives.	3
1.5 Significance of Study	3
1.6 Scope and Limitation of Study	4
1.7 General Methodology	5
1.8 Chapters Outline	6
CHAPTER TWO: LITERATURE REVIEW	7
2.1 Introduction	7
2.2 Tropical Rainforest in Malaysia	7
2.3 Determination of Datum	12

2.4	Digital Mapping	13
2.5	Tree Inventory	14
2.6	Definition Queries Allow Specifying Which Features Of A Layer Draw Based On An SQL Query.	16
2.7	Mapping Clusters	16
2.8	Regression Analysis	17
2.9	Relationship of Growth behavior	22
2.10	Conclusion	24

CHAPTER THREE: METHODOLOGY **25**

3.1	Introduction	25
3.2	Definition of Geographic Information System	25
3.3	Software used	26
3.4	Study Area	28
3.5	The Flowchart of Methodology	30
3.6	Data Planning	31
3.7	Data Collection	31
3.8	Digital Mapping	31
3.9	Data Processing	33

CHAPTER FOUR: RESULT AND DISCUSSIONS **42**

4.1	Introduction	42
4.2	Result of Hotspot	42
4.3	Result of Spatial Autocorrelation	50
4.4	Relationship of Growth Behavior	62
