Thesis submitted in fulfillment
of the requirement for the degree of
Bachelor of Surveying Science and Geomatic (Hons)

Faculty of Architecture, Planning and Surveying

January 2020

AUTHOR'S DECLARATION

I declare that the work in this thesis/dissertation was carried out in accordance with the regulations of Universiti Teknologi MARA. It is original and is the results of my own work, unless otherwise indicated or acknowledged as referenced work. This thesis has not been submitted to any other academic institution or non-academic institution for any degree or qualification.

I, hereby, acknowledge that I have been supplied with the Academic Rules and Regulations for Post Graduate, Universiti Teknologi MARA, regulating the conduct of my study and research.

ABSTRACT

Oil palm is becoming an important source in its production of vegetable oil. Oil palm tree information is important for sustainability assessments and agriculture precision. Therefore, the oil palm tree counting technique is crucial to monitor the development of the oil palm plantations especially when it can to a large area. However, the most difficulties are to develop a method to detect, extract and count trees automatically from the image. This study aimed to develop the automatic oil palm tree counting using remote sensed data and two different algorithms at Felda Pasoh. There are three objectives, firstly, to produce tree height estimation by using the Canopy Height Model (CHM). Secondly, to develop the rule sets of watershed transformation segmentation and local maxima algorithm using Pleiades and LiDAR. Lastly, to compare the accuracy assessment of watershed transformation segmentation and local maxima algorithm. The data used is Pleiades high spatial resolution satellite imagery and LiDAR data. In this study, the software used for data processing and analysis includes eCognition, ERDAS, and ArcGIS. The study is to categorize and evaluates methods for automatic tree counting detection. For the methodology of this study, object-based image analysis (OBIA), watershed transformation segmentation and local maxima algorithm are applied. The CHM result shows the lowest height was determined at 0m and the highest was 9.376m. Therefore, the final output of tree crown shows the watershed transformation algorithm is the best method for use represented oil palm tree counting in the map which is the accuracy assessment is 38.9%.

TABLE OF CONTENTS

ABSTRACT	ii
ABSTRAK	iiii
ACKNOWLEDGEMENT	ii
v	
LIST OF FIGURES	vi
LIST OF TABLES	viii
LISTT OF ABBREVIATION	xi
CHAPTER 1	1
INTRODUCTION	1
1.1 Introduction	1
1.2 Background of Study	1
1.3 Problem Statement	2
1.4 Research Question	3
1.5 Aim of Study	3
1.6 Objective of Study	3
1.7 Scope of Study	4
1.8 Significant of Study	4
1.9 Summary	4
CHAPTER 2	5
LITERATURE REVIEW	5
2.1 Introduction	5
2.2 Oil Palm Tree	5
2.2.1 Oil Palm Tree in Tropical Countries	5
2.2.2 Oil Palm Tree in Malaysia	6
2.2.3 Management Oil Palm Tree	7
2.3 Tree Counting	7
2.4 Methods in Tree Counting Detection	9
2.4.1 Object-Based Image Analysis (OBIA)	9
2.4.2 Watershed Transformation Segmentation	9
2.4.3 Local Maximum Algorithm	10
2.5 Canopy Height Model (CHM)	11
2.6 Remote Sensing in Oil Palm Tree Industries	11

CHAPTER 4.....	40
RESULT AND ANALYSIS	40
4.1 Introduction	40
4.2 Producing Tree Height Estimation by Using Canopy Height Model (CHM) from Airborne LiDAR	40
4.3 Developing the Rule Sets of Watershed Transformation Segmentation and Local Maxima Algorithm using Pleiades and LiDAR data.....	42
4.3.1 Watershed Transformation Algorithm	42
4.3.2 Local Maxima Algorithm.....	44
4.4 Comparing the Accuracy Assessment of Watershed Transformation Segmentation and Local Maxima Algorithm.	45
4.4.1 Segmentation Validation	45
4.4.1.1 Manual Digitizing Output (xi).....	46
4.4.1.2 Segmentation Output (yj)	47
4.4.1.3 Overlapping area between (xi) and (yj) Intersection	48
4.4.1.4 Goodness of Fit Based	48
4.4.2 Output Segmentation.....	50
4.5 Summary	53
CHAPTER 5	54
CONCLUSION.....	54
5.1 Introduction	54
