AKNOWLEDGEMENT

First and foremost, we are very grateful to the Almighty ALLAH S.W.T for letting us to finish our final year project. We are also glad that we can finish our project on time with ease.

Here, we wish to express our sincere appreciation to our supervisor Madam Noor Hidayah Binti Mohd Zaki for encouragement, guidance, suggestions and critics throughout finishing this project. We are also thankful for every kindness that she gave to us throughout these two semesters.

Special thanks to the managers for both cinemas which are TGV Cinemas Aeon Seremban 2 and GSC Cinemas Palm Mall Seremban for giving us the permission to observe the system for the food counter in each cinema. We are thankful for the kindness and help from the staffs of both cinemas.

Most importantly, special thanks also to our family and friends for their external supports to finish this project. Without their supports we cannot finished our project on time.

ABSTRACT

People always need to face with a long queue and waiting for a long time to be served. Usually, in the peak hours such as 12 p.m. until 2 p.m., 6 p.m. until 10 p.m. are always full of people and the long queue continues until the peak hours end. It can lead to dissatisfaction of customers. By comparing Fuzzy Queuing Model and Queuing Theory Model which model is the best model to get the better service performance. The purpose of this study is to investigate the service performance of cinema using fuzzy queuing model. This study suggests several research objectives to be attained which are to compute service performance using Fuzzy Queuing Model for single server and multi-server. Other than that, is to compare service performance between Fuzzy Queuing Model and Queuing Theory Model. The method that we used in this study are Queuing Theory Model and Fuzzy Queuing Model which is DSW algorithm to get the required variables. The data was collected manually at GSC Cinemas Palm Mall Seremban and TGV Cinemas, Aeon Seremban 2. The values of arrival rate, λ and service rate, μ were obtained by calculation with using Queuing Theory Model and Fuzzy Queuing Model. For future observation, other researcher can compare single server for both methods to know which method the best method in maximize the service performance and minimize the service time.

Keywords: Queuing Theory Model, Fuzzy Queuing Model, DSW Algorithm, Multi-server and Single-server queuing system.
