## **ACKNOWLEDGEMENTS**

IN THE NAME OF ALLAH, THE MOST GRACIOUS, THE MOST MERCIFUL

Firstly, we are grateful to Allah S.W.T for giving me the strength to complete this project successfully. Many individuals has involved in completing this project and their contribution must not be mentioned.

We would like to express our gratitude to our supervisor, Madam Farah Azaliney Binti Mohd Amin for guiding us from start until we managed to finish this project. We also want to thank all lecturers in Faculty of Computer and Mathematical Sciences (FSKM) especially to Madam Aminah Binti Abdul Malek and Dr Khairul Anwar Bin Rasmani.

So many challenge we had to face but with patience, support, full commitment and teamwork among us, we manage to overcome it. We take it as a new experience and gaining a knowledge.

Besides, special appreciation to our beloved parent who is the strongest supporters and always give their blessing to us. Last but not least, we also would like to thank our classmates for their help and knowledge in helping our group to finish this project.

## **ABSTRACT**

Islamic unit trust fund in Malaysia has been one of the fastest-growing sectors within the finance industry over the last decades to fulfil the demand from Muslim investors. Muslim investors are only willing to invest their capital if the investment does not conflict with their religious beliefs, namely Islam. There are various types of Islamic fund available in Malaysia which are bond fund, balance fund, fixed income fund as well as equity fund. However, this study focuses on equity fund for investment. Previously, a set of traditional performance measures suggested by Sharpe, Treynor and Jensen's Alpha used beta (systematic risk) or standard deviation (total risk) as their risk variable. In the present study, a performance measurement technique that consider only negative volatility (downside risk) such as Value at Risk (VaR) is proposed. Thus, the main objectives of this study are to measure the performance of five selected CIMB Islamic equity funds from 2016 to 2019 using Sharpe, Treynor, Jensen's Alpha and VaR-Adjusted Sharpe. Eventually, this study also aim to rank the performance of the selected Islamic unit trust funds against Kuala Lumpur Composite Index (KLCI) as the benchmark. Overall, the findings show that CIMB Islamic equity funds underperform the market index, KLCI. Result also show that the ranking using VaR-Adjusted Sharpe are similar to Treynor and Jensen's Alpha compared to the traditional Sharpe ratio. Hence, Value at Risk has been proved to successfully been adapted into Sharpe to evaluate the performance of unit trust funds and all measure successfully have been used. Therefore, this study can be used as a guideline in terms of financial performances as well as beneficial to local Muslim investors in risk management and portfolio optimization.
