Programme	:	Doctor of Philosophy (EC 990)
Faculty	:	Civil Engineering
Thesis Title	:	Effect of strength and stiffness distributions on the displacement demands of asymmetric reinforced concrete buildings
Signature of Student	:	.....
Date	:	June 2016

ABSTRACT

Torsional response characteristics of forty building models of elastic and inelastic asymmetric reinforced concrete buildings were studied by analyzing the near-fault and far-fault ground motions recorded during seven-pairs of recent earthquakes. The strength and stiffness eccentricities are the main parameters used in the present study contributing to the strength and stiffness distributions of building models under five main-models and eight submodels, respectively. The displacement demands of all buildings under the stiff and flexible sides were obtained from the analysis due to different values of fundamental period of vibrations as well as behavior factors by using RUAUMOKO-3D program before raw data of lateral displacement at each node were extracted using FORTRAN program. All data were then summarized in accordance to the strength and stiffness distributions in order to determine the impact of either strength distribution or stiffness distribution to the torsional behavior of one-story asymmetric reinforced concrete buildings. The torsional behavior of all building models were presented in terms of the normalized displacements at the stiff and flexible sides by the ratio of the maximum lateral displacement at the stiff and flexible sides to the maximum lateral displacement at the center of the building models. The results were finally analyzed by using MINITAB software for statistical analysis. The results of this study indicate that the torsional behavior of asymmetric reinforced concrete buildings were mainly depend on the stiffness distributions of lateral load resisting elements in the buildings rather than the strength distributions. The results of these investigations also indicate that the fundamental period of vibrations and behavior factors may increase the lateral displacements depending on the strength and stiffness distributions of buildings. Besides, the displacement demand was found insignificant regardless of the elastic and inelastic systems due to both near and far-fault ground motions. The normalized displacements were found significant to visualize the torsional behavior of asymmetric reinforced concrete building. Nevertheless, the value of elastic and inelastic normalized displacement at stiff and flexible sides was conservative regardless of different fundamental period of vibrations as well as behavior factors, which obey Equal Displacement Rule as used in all seismic design provision including Eurocode 8, considered in this study.

CONFIRMATION BY PANEL OF EXAMINERS	ii
AUTHOR'S DECLARATION	iii
ABSTRACT	iv
ACKNOWLEDGEMENT	v
TABLE OF CONTENTS	vi
LIST OF TABLES	ix
LIST OF FIGURES	x
LIST OF SYMBOLS	xviii
LIST OF ABBREVIATIONS	xxi
CHAPTER ONE: INTRODUCTION	1
1.1 Introduction	1
1.2 Background	1
1.3 Torsion in Building	5
1.4 Problem Statement	6
1.5 Objectives	8
1.6 Scope of Study	8
1.7 Thesis Layout	9
CHAPTER TWO: LITERATURE REVIEW	10
2.1 Introduction	10
2.2 Nonlinear Analysis	12
2.2.1 Nonlinear Time History Analysis	13
2.2.2 Degree-of-freedom System	13
2.2.3 Equation of Motion	15
2.3 Unbalanced Structural System	16
2.3.1 One-story Elastic Studies	18
2.3.2 One-story Inelastic Studies	19
2.3.3 Multi-story Inelastic Studies	21

2.3.4 Strength and Stiffness Distributions 23
2.4 Seismic Response of Building 31
2.4.1 Fundamental Period of Vibrations 31
2.4.2 Behavior Factor 34
2.5 Ground Motion 38
2.5.2 Near-fault Ground Motion 41
2.5.3 Far-fault Ground Motion 42
2.6 Equal Displacement Rule 42
2.7 Statistical Analysis Review Studies 44
2.8 Summary 46

CHAPTER THREE: RESEARCH METHODOLOGY 47
3.1 Introduction 47
3.2 Development of Structural Model 47
3.3 Engineering Structural Model 48
3.3.1 Elastic and Inelastic Key Parameters 48
3.3.2 Modelling of the building systems 50
3.3.3 Properties of the Model 67
3.3.4 Selection of the Ground Motions 69
3.3.5 Data Input Coding Using RUAOMOKO 3D 72
3.3.6 Plastic Hinge and Backbone Curve 79
3.4 Inelastic Displacement Ratio 80
3.5 Data Management 80
3.5.1 Statistical Analysis 81
3.6 Summary 82

CHAPTER FOUR: RESULTS AND DISCUSSIONS 83
4.1 Introduction 83
4.2 Nonlinear Time-history Analysis 83
4.3 Displacement demands of asymmetric buildings 84
4.3.1 Fundamental Period of Vibrations 86
4.3.1.1 Effect of Strength Distributions 88
4.3.1.2 Effect of Stiffness Distribution 95
4.3.2 Due to Behavior Factor 106
