## ABSTRACT

This paper has investigated the effect of agricultural production on environment in Malaysia. Based on credible past researchers, some agriculture production does affect the environment of the surrounding.

This research study is conducted by using secondary data where sources are collected from worldbank data, index mundi, Department Of Statistic(MAMPU-[www.data.gov.my](http://www.data.gov.my)) and Malaysian Cocoa Board. Which cover the duration from 1985 until 2014 by using monthly basis.

Therefore the Carbon Dioxide will be the dependent variable while Palm Oil Production (POP), Rubber Production (RP) and Cocoa Production (CP) as independent variables in this research study.

According to the result of this research study,the independent variables have both positive negative relationship towards the dependent variable.
