ACKNOWLEDGEMENTS

Assalamualaikum

Alhamdulillah, thanks to God because with His permission I have been successful finish my Final Year Project and a number of people have made significant contributions to the preparation of this report. Their insights, advices and suggestions help me a lot. Firstly, I am very much thankful to my Co-supervisor, Assoc. Prof. Dr Norlida Kamarulzaman for her encouragements and valuable suggestions for incessant improvement of this report. I would like to express my sincere gratitude and appreciation to my supervisor Mrs. Nur Amalina Mustaffa for all necessary information and guidance as well as many technical help throughout the year. Finally, I would also like to thank to my family and friends for their continued supports and encouragements.

ABSTRACT

CONDUCTIVITY STUDIES OF Fe_2O_3 AND FeAlO_3 PREPARED BY SOL GEL METHOD

Fe_2O_3 and FeAlO_3 were synthesized by sol gel method with Iron (III) nitrate nonahydrate, $\text{Fe}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$ and Aluminum nitrate nonahydrate $\text{Fe}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$ as the starting materials. The structure of the materials were characterized by XRD (x-ray diffraction) using Xpert Highscore Plus and the conductivity of the materials have been studied using WEIS510 Multichannel EIS (electrochemical impedance spectroscopy) System. The result indicated that Fe_2O_3 was obtained as a pure crystal structure and clearly assigned to $\alpha\text{-Fe}_2\text{O}_3$ (hematite). For the FeAlO_3 the result shows that the material is obtained as mix-phase.

CHAPTER 1

INTROCUCTION

1.1 Background of study

Nanomaterials are the field that takes a materials science-based approach to nanotechnology. It studies materials with morphological features on the nanoscale, and especially those which have special properties stemming from their nanoscale dimensions. Nanoscale is usually defined as smaller than a one tenth of a micrometer in at least one dimension, (Cristina Buzea et al., 2007) though this term is sometimes also used for materials smaller than one micrometer.

Nanotechnology, or the use of nanomaterials are these materials can mimic surface properties (including topography, energy, etc.) of natural tissues. For these reasons, over the last decade, nanomaterials have been highlighted as promising candidates for improving traditional tissue engineering materials. Importantly, these efforts have highlighted that nanomaterials exhibit superior cytocompatible, mechanical, electrical, optical, catalytic and magnetic properties compared to conventional (or micron structured) materials. These unique properties of nanomaterials have helped to improve various tissue growth over what is achievable today. (Lijie Zhang and Thomas J. Webster, 2008)
