## AUTHOR'S DECLARATION

I declare that the work in this thesis was carried out in accordance with the regulations of Universiti Teknologi MARA. It is original and is the results of my own work, unless otherwise indicated or acknowledged as referenced work. This thesis has not been submitted to any other academic institution or non-academic institution for any degree or qualification.

I, hereby, acknowledge that I have been supplied with the Academic Rules and Regulations for Post Graduate, Universiti Teknologi MARA, regulating the conduct of my study and research.

Name of Student : Fatimah Bebe Binti Mohamed Hussain

Student I.D. No. : 2010867416

Programme : Doctor of Pharmacy (Science) – PH990

Faculty : Pharmacy

Thesis Title : Secondary Metabolites from Selected Fungal  
Endophytes from *Uncaria* sp. and Svalbard plants

Signature of Student : .....

Date : February 2021

## ABSTRACT

Endophytes are microorganisms that inhabit host plants asymptotically and have a fascinating potential as a source of new drug leads in many sectors. Studying microorganisms from a variety of biotopes increases the chances to isolate structurally diverse metabolites. In this respect, psychrophiles from the Arctic fulfil the criteria of an interesting source of potential new drugs. However, endophytes from tropical regions should be able to resist stronger competition through the production of various antimicrobial agents. This study included 31 endophytic fungi that were isolated from ten plants from Longyearbyen, Svalbard Island, Norway, and 54 endophytic fungi obtained from three plants belonging to the *Uncaria* family growing in UiTM Puncak Alam's biological reserve, Malaysia. The objective of this study was to isolate secondary metabolites from endophytic fungi whose extracts demonstrated antimicrobial properties. Ethyl acetate extracts of all the isolates were analysed by HPLC and evaluated for preliminary screening of antimicrobial activity against *S. aureus*, *E. faecium*, *P. aeruginosa*, *E. coli*, and *C. albicans*, using the MTT assay. From the analysis of the above data, 4 out of 85 (3 Malaysian and 1 Arctic) endophytic fungal isolates were selected for further investigation. These include *Nigrospora oryzae*, *Diaporthe phaseolorum*, *Trichoderma virens*, and *Poaceicola* sp., which were identified by morphological and genetic techniques. The crude extracts were fractionated, and their components purified by semi-preparative HPLC. Chemical structures were determined based on spectroscopic methods including MS, NMR, UV/Vis, ECD and X-ray diffraction techniques. The *Nigrospora oryzae* extract included two major and three minor compounds. They were subsequently identified as pestalopyrone, hydroxypestalopyrone, 4-dehydroxyaltersolanol A, macrosporin, and altersolanol B, respectively, via comparison of their spectral data. The absolute configuration of 4-dehydroxyaltersolanol A was unambiguously confirmed by X-ray crystallography, ECD spectral analysis in combination with quantum chemistry simulations. An extract derived from *Diaporthe phaseolorum* was found to contain cytochalasins H and J. From the *Trichoderma virens* culture, two compounds were identified, namely gliocladic and heptelidic acids. Finally, from the culture of *Poaceicola* sp. one known compound was identified, annularin D. Five new polyketides, including (-)-cleanarol C ( $C_{13}H_{14}O_4$ ), (-)-3,8-dihydroxy-3-hydroxymethyl-6-methoxy-4,5-dimethyl-isochroman-1-one ( $C_{13}H_{16}O_6$ ) and svalbardines A ( $C_{16}H_{14}O_6$ ), B ( $C_{32}H_{28}O_{12}$ ) and C ( $C_{10}H_{14}O_4$ ) had their structures established. Svalbardine A was determined as a new pyranochromene, while svalbardine B was assigned a new carbon skeleton based on a spiro chromone-oxanaphthalene frame. Svalbardine C was determined as a hydroxylated derivative of annularin D, while the remaining two compounds were new enantiomers of known structures. Most of the known compounds mentioned above were previously recognised for their antimicrobial properties and can be regarded as responsible for the overall activity of the crude extracts during the MTT screening, thus vindicating the initial hypothesis. It is therefore believed that this work could be the basis for a more targeted search of novel antimicrobials.

## ACKNOWLEDGEMENT

In the name of Allah, the Most Gracious and the Most Merciful. First and foremost, Alhamdulillah, all praises to Allah for the strengths and His blessing in completing this thesis.

I would like to take this opportunity to extend my utmost gratitude and appreciation to my supervisors Assoc. Prof. Dr. Sadia Sultan, Prof. Dr. Jean-Frédéric Faizal Weber Abdullah and Prof. Dr. Kalavathy Ramasamy for all their sincere advices, ideas, guidance and support during the course of this thesis.

I would like to express my appreciation to the Dean of the Faculty of Pharmacy, Assoc. Prof. Dr. Shariza Sahudin, for her close follow ups, support, and help. My acknowledgement also goes to all the technicians and office staffs of the Faculty of Pharmacy for their co-operations.

My deepest thank go to all AuRIns' members, especially to the successive Directors, laboratory staffs, and postgraduate students. My special thanks to Dr. Anis Low, Dr. Humera Naz, Dr. Nurhuda Manshoor, Dr. Syed Adnan Ali Shah, Dr El Hassane Anouar, Mrs. Juliana Yusoff, Mr. Nauman Sajid, Mr. Mohd Syukri Baharudin and other staff for their comments and advices. I would also like to extend my gratefulness to my bench work friends and everyone who has contributed to this research.

I owe a special debt to my beloved family who has given me infinite support especially my mother Rajula Bebe Bt Abdul Rahman, my brothers Haji M. Gulam Rasul, Mohamed Kasim, my sisters and brothers, my friends for their endless encouragement, prayers and support throughout this journey. Lastly, I am deeply grateful for the love, help and sacrifice that I have received from my husband, Shaik Abul Hasan, who help and supported me with great patience.

Thank you very much.
