ACKNOWLEDGEMENT

Bismillahirrahmanirrahim.

Alhamdulillah, all praises to Allah SWT the Most Gracious and the Most Merciful that with His blessings, we are able to complete our work despite all the obstacles we faced.

We must thank and acknowledge Universiti Teknologi Mara (Terengganu) Malaysia for awarding us the Excellence Fund to do this research in UiTM (T). Our research would not have been feasible without the full support from this inspiring institution.

We would like to express our deepest love and gratitude to all our dearest family members for providing us unfailing total support.

Last but not least, we also would like to record our sincere acknowledgement to Professor Dr Abdul Rahim Abdul Rahman from International Islamic University Malaysia for his crucial contributions, helpful comments, never ending encouragement and valuable expertise in this field.

Thank you.

ABSTRACT

This study examines the relative efficiency of the nine Islamic subsidiaries and nine commercial banks in Malaysia from the year 2008 to 2010. To measure relative efficiency of the selected banks, the study applies the Data Envelopment Analysis in the analysis. The study adopts the intermediation approach in defining the inputs and outputs. The study selects personnel expenses and total customers deposits as inputs, while the output is total loans. This study found that the technical inefficiency of the selected banks in 2008 was due to the pure technical inefficiency. This indicated that the scale efficiency was higher than the pure technical efficiency. However, in 2009 and 2010, the pure technical efficiency was higher compared to the scale efficiency. Hence, the technical inefficiency was due to the scale inefficiency. Later, the study compares the efficiency of the Islamic subsidiaries and commercial banks using the independent sample t-test. The study found that there is no significant difference in the technical efficiency and pure technical efficiency level for Islamic subsidiaries and commercial banks. On the other hand, there is a significant difference in the scale efficiency level for both banks at $p=0.014$.
