PENGHARGAAN

Setinggi-tinggi penghargaan dan ribuan terima kasih diucapkan kepada semua pihak yang terlibat secara langsung dan tidak langsung bagi membolehkan penyelidikan ini disiapkan dengan sempurna.

Diantaranya :

Prof. Madya Dr. Mustaffa bin Mohamed Zaid
(Penolong Naib Canselor, InKA)

Prof. Madya Tengku Yusoff Tengku Mahmud
(Pemangku Pengarah Kampus UiTM Terengganu)

Prof. Madya Wan Dorishah Wan Abdul Manan
(Timbalan Pengarah Kampus HEA UiTM Terengganu)

Prof. Madya Norsidah Ahmad

Tuan Haji Zainuddin Zakaria
(Ketua Unit Institut Penyelidikan, Pembangunan dan Pengkormesialan UiTM Terengganu)

dan

Seluruh ahli keluarga dan rakan-rakan yang memberi dorongan dan sokongan

ABSTRACT

Seven types of fish sold for human consumption were subjected to DNA extraction using Qiagen DNeasy® Tissue Kit. The genomic DNA of only five fish samples was successfully extracted. The extracted DNA was then subjected to PCR amplification targeting the 359 base pair (bp) mitochondrial cytochrome b (cyt b) gene. A pair of universal primers cyt *b1* and cyt *b2* was used which consistently amplified a fragment of the cyt b gene of the fish samples. All fish samples except *Megalaspis cordyla* were successfully amplified.

The 359 bp amplicons of PCR assay of fish samples were then subjected to RFLP using four different restriction enzymes, namely *Bfa* I, *Hinf* I, *Msp* I and *Mbo* II. None of the fish samples was fragmented by *Bfa* I. *Polydactylus pleibeius* and *Rastrelliger kanagurta* were also not being cleaved into fragments when their DNA were subjected to digestion with *Msp* I. However, the 359 bp of *Pampus argenteus* and *Trachinotus baironii* were further fragmented into two when they were digested with *Msp* I. The same results were obtained when the 359 base pairs of all fish samples were digested with *Hinf* I and *Mbo* II. The DNAs were cleaved into one to two fragments. The fragments generated have different sizes i.e. in a range of 104 bp to 300 bp. The results obtained were unique to the fish types. Three different REs (*Hinf* I, *Msp* I and *Mbo* II) were found to be sufficient in determining the fish species thus indicating that the PCR-RFLP analysis of cyt b represents a rapid, simple and promising method for differentiation of fish species.
