ABSTRACT

TAXONOMIC REVISIONS OF DIPTEROCARPACEAE IN KINABALU PARK, KUNDASANG SABAH

The total number of Dipterocarpaceae Deposited Specimens Voucher (DSV) in Kinabalu Park is 143. It is categories into 7 genera which are *Anisoptera* Korth, *Dipterocarpus* Gaertn.f, *Dryobalanops* Gaertn.f, *Hopea* Roxb, *Parashores* Kurz, *Shorea* Roxb and *Vatica* L. There are 45 species and 9 unknown species deposited. The unknown species are *H. sp* (SNP 1903) which deposited to *H. dyeri* F. Heim, *S. sp* PEK (KB 266) deposited to *S. foxworthyii* Symington, *S. sp* PEK (DA 942) and PEK (AB 608) deposited to *S. gibbosa* Brandis, *S. sp* PEK (AB 607) deposited to *P. tomentella* (Symington) Meijer, *S. sp* PEK (MR 319) deposited to *S. parvistipulata* F. Heim, *V. sp* (SNP 0163) and (SNP 0457) deposited to *V. albiramis* Slooten, and *V. sp* (SAN 94289) deposited to *S. laevis* Ridl. There are 4 invalid DSV detected. The invalid DSV are *H. beccariana* Burck (SP 18147) which the characteristics are resemble to *H. mengerawan* Miq, *H. semicunenata* Symington (PEK (MR 300)) to *S. laevis* Ridl, *P. malaanonan* (Blanco) Merr (SP 18145) to *P. tomentella* (Symington) Meijer, and *S. dasyphylla* Foxw (SP 18783) resemble to *S. parvistipulata* F .Heim. Key dichotomous of Dipterocarpaceae in Kinabalu Park is constructed based on Ashton's field characteristics.

CHAPTER 1

INTRODUCTION

1.1 Background Study

Systematic is the study of the diversity of organisms and their natural relationships which sometimes used as a synonym for taxonomy. Taxonomy is the study of the theory, practice and rules of classification of living and extinct organisms (Elizabeth and Robert, 2000). In Systematic botany study, it is classified into taxonomy monographs and taxonomy revision. A monograph is a systematic taxonomy which synthesis of all known information about the taxon of a particular species. The taxonomy revision is a comprehensive account of the taxon which incorporates much lesser details of the plant. The revision study of this paper will only restrict to Dipterocarpaceae family which referring to Kinabalu Park deposited voucher specimens (Bhattacharyya, 2005).

Dipterocarpaceae also known as timber plant is a tropical rain forests plant of Asia contains over 470 species which is well-known for its important in economic area (Dutta *et al.*, 2011). In typical low land evergreen forest in South East Asia, the family of these trees contributes to 30% of the total area (Ashton 1982). Furthermore, the origin of Asian Dipterocarps is in Gondwana, India and
