## AUTHOR'S DECLARATION

I declare that the work in this thesis was carried out in accordance with the regulations of Universiti Teknologi MARA. It is original and is the results of my own work, unless otherwise indicated or acknowledged as referenced work. This thesis has not been submitted to any other academic institution or non-academic institution for any degree or qualification.

I, hereby, acknowledge that I have been supplied with the Academic Rules and Regulations for Post Graduate, Universiti Teknologi MARA, regulating the conduct of my study and research.

Name of Student : Amal Asyikin Binti Abdul Halim

Student I.D. No. : 2014434588

Programme : Master of Science – AS760

Faculty : Applied Sciences

Thesis : Non-Invasive Evaluation of Myoglobin Oxygenation States using Functional Near Infrared Spectroscopy (FNIRS)

Signature of Student :

Date : June 2019

## ABSTRACT

This thesis describes an investigation of the myoglobin oxygenation states measured by non-invasive functional near infrared spectroscopy (FNIRS). This non-invasive evaluation could extract much information using a safe non-invasive method in order to diagnose the level of oxygenation status throughout human body. There are two important studies in this thesis and there are from simulation and experimental in vivo using FNIRS. At first, Monte Carlo simulations with Modified beer lambert law have been performed to determine light propagation based on (1) variation of epidermis thickness layer (0.001, 0.002, 0.004, 0.02 and 0.2 cm), (2) variation of fat thickness layer (0.1 - 0.2 cm) and (3) variation of oxygenation (0-55%) at dermis and muscle layers for spectral range from (600 - 900 nm). Next, derived measurement of muscle oxygenation and deoxygenation from myoglobin were examined during the exercise, before and after exercise by each volunteers. Muscle oxygen consumption ( $MVO_2$ ) is calculated based on arterial Venous Occlusion Test (VOT) and acts as important reading to assess the myoglobin oxygenation especially from myoglobin signal at regional fatigues level under isometric exercises. Maximum isometric contraction is based on One Repetition Maximum (1RM) measurement at (0, 10, 30 and 50%) of isometric exercise on flexor digitorum superficialis (FDS) muscle using FNIR spectroscopy. Based on the simulation result, the change in optical density is significantly decreased and the linearity of measurement characteristics is clearly distorted by the presence of a larger thickness layer of epidermis about maximum 0.2 cm. This study attempt to show a suitable modelling of light propagation passing into deeper layer since there is no a lot of different of absorbance for fat thickness 0.1 cm and 0.2 cm. Apart from that, the experimental result showed deoxygenated myoglobin (Mb) increase with a faster rate during moderate and heavy level of isometrics contraction due to the rapid increase in oxygen extraction from local blood capillary into muscle tissues. Thus, this result may help us to prove that our human muscle is transparent to this near infrared region and might be useful tool for detecting oxygen status in muscle from living people either athletes or working people.

## ACKNOWLEDGEMENT

First and foremost, I would like to express my gratitude to my academic supervisor Prof. Engr. Dr. Mohamad Rusop Mahmood (NANO-SciTech Centre, Institute of Science, UiTM Shah Alam) for the opportunity to pursue graduate work, his intellectual guidance, supervision and ideas in assisting me to complete this thesis. His scientific discussions and his suggestions have made a huge impact on me, which would help me in my future endeavors.

I would like to thank my co-supervisor from industry, Mr. Muhammad Hafiz Bin Laili (Senior Researcher, Photonics R&D, MIMOS Semiconductor Sdn Bhd, TPM Bukit Jalil) for teaching and giving me helpful advice in this research and directly contributed greatly to the quality of this thesis. Thanks also to Prof. Dr. Md Saion Bin Salikin (Medical Imaging, Faculty of Health Sciences, UiTM Puncak Alam) who generously guided and gave lots of help during ethics application before of his retirement and also acts as co-supervisor.

The research for this thesis was conducted in the Photonics Laboratory and NANO-Scitech Centre at the MIMOS Semiconductor Sdn Bhd, TPM Bukit Jalil and UiTM Shah Alam. I would like to thank laboratory research team, Mrs. Nur Ain Binti Aziz and Mr. Abdur Rehman Bin Laili from MIMOS Semiconductor Sdn Bhd for valuable discussion on the model simulation set up, their technical expertise, easy-going manner and friendship. This study was supported by Science Fund Grant (06-03-04-SF0057) from the Ministry of Science and Technology and also MyBrain15 from the Ministry of Education.

Lastly, a special thanks to all my family members from Kelantan especially to my beloved parents, Abdul Halim Bin Seman and Aini Binti Abdullah for their financial support, unwavering love, endless support, encouragement, persistence inspirations and understanding. Special thanks also to my close relatives from Serdang, Noriah Binti Abdullah and Rosli Bin Salaman for their support and understanding throughout this journey. Al-Fatihah to my grandmother, Habsah Binti Sulaiman. Your unconditional love are always remembered. Alhamdulillah.
