

**UNIVERSITI TEKNOLOGI MARA**

**END TO END PERFORMANCE ANALYSIS OVER IP RAN NETWORK**

**ARMI SHAHRAN BIN MOHAMAD**

Thesis submitted in partial fulfillment of the requirements  
for the degree of  
**Master of Computer Networking**  
**Faculty of Computer and Mathematical Science**

**May 2011**

## **ACKNOWLEDGEMENT**

Assalamualaikum w.b.t

Alhamdulillah, thanks to the Almighty for blessing me with strength and courage to complete this thesis. In the midst of preparing and completing this thesis, I have the privilege of obtaining assistance and guidance from various sources. Therefore, I would like to express my deepest appreciation to those involved in this project.

First and foremost, I would like to express my appreciations and millions of thanks to my project supervisor, Dr Kamarularifin Abdul Jalil, who had sacrificed his precious time and effort in providing me with ideas and guidance in order to complete this dissertation. All of his contributions will be kept in my mind and in my heart, will be remembered and appreciated, as it is such a priceless effort for me.

I also would like to express my appreciation to my sister, Wani Mastura Binti Mohamad for making this research to be augmented with their priceless guidance, technical ideas and brilliant critics to make the best of this research.

Last but not least, I would like to express my appreciation to my beloved parents as without their moral and financial support, I would not make it until today. For all my friends in CS778, I would like to thank for their help, friendship and countless support to me. May Allah S.W.T. bless all of them for their kindness and supported.

## ABSTRACT

As mobile networks evolve, increased attention is given to transport in the Radio Access Network (RAN). Moreover, mobile backhaul network will inevitably transform to an IP RAN as mobile networks move towards IP and broadband. In order to keep pace with the growth, “IP” RAN network were introduced to replace the current ATM connection at the IuB interface. With the additional header compression and packet multiplexing technologies, IP networks provide higher efficiency than ATM. However ATM continues to be a popular choice by telecommunication companies and service providers because of the ability to provision Peak Cell Rates (PCR) to specific Virtual Circuits (VC) and at the same times provide bandwidth guarantees. Due to that functionality, ATM makes a good choice for a network that must handle both traditional high-speed data (e.g. File transfer), and real time, low latency content such as voice and video. IP RAN however takes the advantage of dynamic routing protocols which allow routing to occur and the network can ‘self-heal’ and find alternate paths to a destination if there is one when a node fails. Since IP is best effort, there is no guaranteed of delivery and packets might be dropped. In order to compare the end to end performance for both IP RAN and ATM network, various types of traffic such as MMS (Scenario 1), HTTP Connection (Scenario 2) and FTP downloading (Scenario 3) are chosen and analyzed. The expected result from the test experiment is able to produce set of information such as uplink and downlink duration time, throughput downlink pattern comparison, bytes received comparison and data transfer time taken. Based on the analysis result, end to end performance of IP RAN networks were better in term of throughput downlink and time duration especially during huge traffic load (peak hour). For future research, similar scientific analysis will be deploy on Long Term Evolution Network (4G) which is focusing on scheduling algorithms in different traffic conditions such as VoIP and Mix Traffic (Web Browsing, FTP & Steaming).

## TABLE OF CONTENTS

Certification of originality	i
Acknowledgement	ii
Abstract	iii
Table of Contents	iv
List of Tables	viii
List of Figures	ix
<b>CHAPTER 1: INTRODUCTION</b>	<b>1</b>
1.1 Project Background	1
1.2 Problem statements	4
1.3 Objective	6
1.4 Scope of the project	6
1.5 Significant of Study	7
1.6 Requirement	8
1.6.1 Hardware	8
1.6.2 Software	8
1.7 Dissertation Outline	9
<b>CHAPTER 2: LITERATURE REVIEW</b>	<b>10</b>
2.1 Role of IP in Mobile	10
2.2 Rationale for using IP in cellular	11
2.3 Cellular evolution	12
2.4 The IP packet Core Elements	15
	iv

2.4.1	Node B	15
2.4.2	Radio Network Controller (RNC)	18
2.4.3	Universal Terrestrial Radio Access Network (UTRAN)	18
2.4.3.1	IuB Interface	20
2.4.3.2	Asynchronous Transfer Mode (ATM)	22
2.4.3.3	IP Protocols	25
2.4.4	Serving GPRS Support Node (SGSN)	26
2.4.5	Gateway GPRS Support Node (GGSN)	27
2.4.6	Domain Name System (Gn DNS)	28
2.5	Mobility Management	28
2.5.1	Idle Mode	29
2.5.2	Standby Mode	30
2.5.3	Ready Mode	30
2.5.4	GPRS Attach Procedure	31
2.5.5	Session Management	32
2.6	Multimedia Messaging Service (MMS)	34
2.6.1	E2E Element for MMS Flow	36
2.7	WAP Gateway	37
2.7.1	WAP Flow	37
2.8.	Related Works	39
