ABSTRACT

This paper analyzed the determinants of health expenditure in Malaysia. The study used E-View time series model to determined significant relationship between gross domestic product, total of population, carbon dioxide emission, life expectancy, and mortality rate towards health expenditure in Malaysia, which covering data for 30 years from 1988 until 2018 . The empirical results have found that all of the variables are significant relationship towards health expenditure in Malaysia. The results give additional understanding of the relationship between these independent variables and health expenditure in Malaysia.
