## ACKNOWLEDGEMENT

By the name of ALLAH, the Most Gracious and Most Merciful.

Immeasurable gratitude to Allah S.W.T. for giving this servant opportunity to undertake and complete this project in the dateline time.

I wish to express my thanks and appreciation to my supervisor, Puan Zulaile Mabni for her guidance, support, encouragement and constructive criticism that I had been receiving for the preparation of this thesis. I never forget all the experience during doing this project. I also wish to express my sincere appreciation to project coordinator, Dr. Siti Salwa Salleh and Dr. Nasiroh Omar for their guidance from last semester until end of this semester.

For my beloved family especially my mother that has supported me from the beginning and until now, I would like to appreciate them in all my life. Without encouragement from them I will not be here now. Not forget to all my friends that support and help me until the project and the report are successfully completed.

Last but not least, an expression and gratitude to all individual who involved directly or indirectly in completely this project.

Thank you all!

## ABSTRACT

A budget is simply an organized way of managing users' finances. It enables them to identify and balance money coming in (income) and money going out (expenditure). Financial problems are a common problem in today's society. Many users discover, at the most inconvenient and embarrassing times that their expenses have exceeded their income. These problems exist because users are not organized and well-planned with their finances. Most of the users already organize their financial resources by a manual process being conducted on pieces of paper. This is improper way to keep track of the funds either expenditure or saving. These problems make users have difficulties in managing their financial resources although have some application or system to organize their spending. The aim of this project is to implement spending plan using dynamic programming technique and to develop prototype of mobile budget planner that has an ability to help users in making decision of their budget. In this project research, the dynamic programming technique is used to solve the problem where given a fixed budget, the application will suggest to the users what they should buy. The target user of this application is student because as a student with a very limited income they might think that budgeting is a pointless activity. In fact, the less money they have to live on, the greater the necessity to budget. NetBeans Integrated Development Environment (IDE) 6.1 and Java JDK1.6.0\_05 will be used as software requirement during the development phase before transferring the application into mobile phone as hardware requirement. As a conclusion, mobile budget planner enables them to make the suitable use of the limited resources they have.

Keyword: Mobile, Budget Planner, Dynamic Programming Technique.
