## ABSTRACT

Managing coordination between Autonomic Managers in the autonomic cloud environment requires an effective control mechanism to handle issues, namely, the coordination conflict between Autonomic Managers during planning and execution phase of MAPE-K framework. This framework provides a primary control loop in managing automated adaptation process with multiple autonomic managers. Existing work have address autonomic managers being designed to address certain problem, but issue remains in coordinating the autonomic manager within decentralized environment for an appropriate and effective global self-adaptive management. The objective of this research is to show and prove that coordination between Autonomic Managers with negotiation and synchronization protocol during planning and execution phase respectively, able to resolve this issue and providing better overall control within the adaptation process. This research introduces a new specialty and novelty coordination model by combining negotiation and synchronization during planning and execution phase accordingly based on the MAPE-K control loop. Negotiation allows two parties to discuss to meet particular agreement while synchronization controls execution process according to agreed negotiation result. This new coordination model is evaluated by using the enhanced CloudSim simulator by integrating with a message broker. The result from the experiment shows that combination of negotiation and synchronization can manage coordination conflicts during a runtime adaptation.

## ACKNOWLEDGEMENT

First and foremost, I would like to thank God Almighty for giving me the opportunity to embark on my Master and completing this long and challenging journey successfully.

Thank you to all who have been supporting this work especially Dr Azlan Ismail, and Prof. Dr. Siti Zaleha Zainal Abidin. The achievements of this Master thesis would not have been accomplished without the guidance and help from my supervisors. I would like to express my honest appreciation to them for giving me the opportunity of following my Master work, for their encouragements and availability throughout the years of my study, for their insightful direction, for their patience, and for their total support.

I would like to thank my wife, Asfa Zuhairan Hassan and all my 4 little sons, Adam, Aariz, Ariff and Aqeel, for their total support and understanding within and outside work, and for all the things that make me moved on to complete this thesis. Alhamdulillah.
