# ACKNOWLEDGEMENT

In the name of Allah

Firstly, I would like to express my gratitude towards my supervisors Puan Bibi Norasiqin Bte Sheikh Rahimullah and my lecturer, Prof.Madya Dr. Shah Rizam Bte Mohd Shah Baki for their kindness in allowing me to work under them. Their guidance, motivation and full support are greatly appreciated. Without them, this work would not be materialized.

I would also like to express my appreciation to Dr Mohd Nasir Bin Taib and Dr Haslinda Bt Hassim as the panel members in the technical presentation of this project for their comment and advise.

I also indebted for the various help and discussion offered by my friends and lecturers for their support and advise. Also, to all person who have been involved directly or indirectly.

Lastly, I also like to express my gratitude to my family for their understanding, support and encouragement in completing this course and project report.

‘May almighty Allah bless and reward them for their generosity’

## ABSTRACT

This report describes the fuzzy logic application in transmission control for vehicle. The developed program performed by Fuzzy TECH Version 5.12 is proposed for the design of controller to be applied in the transmission control. The developed program is then simulated using MATLAB SIMULINK to verify its performance in this application. The advantage of the fuzzy logic system is that it allows multiple types of input such as that from vision and ultrasonic sensors as well as stored map information to be used to guide the vehicle when detecting objects. The data is collected through environment surroundings which is detected by the vehicle sensors by moving at all angles. For the purpose of this project, the Mamdani type of fuzzy controller was used. The developed program is based on two behaviors consists of angle and distance of objects. This project also applies efficient command fusion, which helps the fuzzy controller to generate crisp command that carries information from both behavior requirements. The assessments of the controller performance are performed using the MATLAB Fuzzy logic toolbox and MATLAB SIMULINK programming environment. The alternative type of process monitor forms an assessment of controller performance based on readily measured variables.
