ABSTRACT

Cellular networks face numerous challenges in providing services for indoor users. Therefore, femtocells are suggested as a solution to indoor coverage issues that macro cells have failed to address to date in cellular networks such as Global System for Mobile Communication (GSM), Universal Mobile Telecommunications System (UMTS), and Long Term Evolution (LTE). Although femtocells can provide various benefits for both operators and users, many technical challenges must be resolved for effective femtocell deployment in real environments. In this thesis, the network interface, the packet scheduling and the interference management challenges are investigated in order to address these issues with proper solutions. The network interface challenge is related to the integration of the femtocell in a cellular network such as LTE. The proposed solution is to deploy an IP Multimedia Subsystem (IMS) as an integration platform between the femtocell and the LTE cellular network. Thus, an IMS module has been implemented for signalling in a LTE-based femtocell network that contains both registration and invitation procedures. Based on this study, it has been observed that the integration of an IMS in a LTE based femtocell network can improve the network performance since the Packet Loss Ratio (PLR) can be minimised. For the packet scheduling challenge, the authors propose a resource block preserver (RBP) scheduling algorithm in the downlink of the LTE based femtocell network. The RBP algorithm has two layers, upper and lower. The upper layer of the RBP exploits the LTE frame concept that contains a number of sub-frames, whereas the lower layer of the RBP algorithm adopts the concept of a Proportional Fair (PF) algorithm to schedule the non-real time (NRT) flows, while an Exponential/Earliest Deadline (Exp/ED) algorithm is applied for the real time (RT) flows. The proposed RBP scheduling algorithm outperforms the well-known scheduling algorithms in terms of a lower PLR among users in the LTE based femtocell network. Finally, a self-organising power control mechanism is proposed as an interference mitigation scheme for the LTE femtocell network. The notion is based on adjusting the transmission power of the femtocell based on the interference power received at the femtocell downlink in order to reduce the interference between adjacent femtocells. The power adjustment is controlled centred on relevant factors such as the number of femtocells and the distance between the femtocells and the subscribers. Through this study, it has been found that by utilising the proposed interference mitigation scheme, the interference between neighbouring femtocells can be reduced and a desirable QoS for subscribers can be provided when performing RT services.

ACKNOWLEDGEMENTS

Praise be to GOD for His mercy, blessings, and assistance in preparing this work and for successfully completing this long and challenging journey.

I would like to express my deepest thanks and gratitude to my supervisors, Professor Dr Mohd Dani Baba for his kind supervision from start to end of my research work. He guided me at every step in the development of innovative ideas and modern trends in this field of study. I have learned much from my supervisor in terms of his research ability, impressive style of presentation, technical talk and writing technical reports and papers. Also, I wish to express my sincere thanks to my co-supervisor, Assoc Prof Hj Mohd Asri Hj Mansor, for his generous help at all stages of this research work. In spite of their hectic schedules, they remained always approachable and took time out from their busy lives to attend to my problems. I am very honoured to have them as my supervisors.

I am indebted to Universiti Teknologi MARA (UiTM) and my acknowledgement is especially directed to the Faculty of Electrical Engineering (FKE), Universiti Teknologi MARA (UiTM) for the reserved space and use of their facilities.

I owe my greatest thanks to my wife and parents. They have suffered and lost a lot due to my research abroad. Without their encouragement and understanding, it would have been impossible for me to finish this work.

A special thanks to Mr Mohammad Tariq Ibrahim, Mr Ammar Bathich and Mr Omar Osama for their precious ideas, advice and encouragement.

Last, but not least, I would like to thank all my colleagues for their help and assistance.
