December 2017

ABSTRACT

Rubber plantation is one of the popular plantations in Malaysia since last decade. However, rubber plantation has become less popular and plantation owners more interested with oil palm plantation. This phenomena give affect to wood manufacturers in Malaysia because rubberwood is one of their main material. Introduction of fast growing species such as *Leucaena leucocephala* to mix with rubberwood as alternative material is very important to make sure enough feed stock to the industry. The main objective of the study is to determine the physical and mechanical properties of high density fibreboard (HDF) from *Leucaena leucocephala* and rubberwood. Meanwhile, physical properties, chemical properties and fibre morphology of *Leucaena leucocephala* had been studied. In manufacturing of high density fibreboard (HDF), *Leucaena leucocephala* wood and rubberwood were used as a wood material and urea melamine formaldehyde (UMF) resins as a binder. This study involved three factors of age, ratio and resin content. Quality of the boards were evaluated by determining the bending properties (modulus of elasticity and modulus of rupture), internal bond (IB) strength and thickness swelling (TS). Test specimen preparation and evaluation of the board were carried out according to Japanese Standard (JIS A 5905: 2003). From this study, the statistical analysis revealed that age was found to significantly affect on physical properties of wood. Fibre morphology indicated that, the fibre length and slenderness ratio had positive significant correlation with age. In the chemical analysis of *Leucaena leucocephala*, age was found to affect ash content. In the manufacture of HDF, age of *Leucaena* tree was found to affect MOR and IB only. While, factor of ratio were found not affect all the properties of HDF. The physical properties of HDF were found to be significantly affected by resin content with increase of resin content from 15% to 20%. Increased in the ratio of *Leucaena* wood had contributed to better mechanical properties of HDF. Two variables show a better result with three year old *Leucaena* and 20% UMF resin dosage. This study had proven that it is suitable to used *Leucaena leucocephala* wood and technically possible to use a short rotation *Leucaena leucocephala* for the manufacturing of HDF which meet the minimum requirement Japanese standard for mechanical properties. Meanwhile, correlations of physical, chemical properties and fibre morphology of *Leucaena* wood had show less association with the board properties.

ACKNOWLEDGEMENTS

Firstly, Thank to Allah the Al-mighty for giving me the opportunity to embark on my Master and the completing this journey. My gratitude and thanks to my supervisor Assoc. Prof Dr. Wan Mohd Nazri Wan Abdul Rahman who always encourage, support and guidance throughout all stages of this project. To my co-supervisor, Professor Jamaludin Kasim and Dr Sufian Misran, I would like to express sincere thanks for help and advice. I also would like to express my gratitude to the lecturers and staff of Wood Industries Department of UiTM Pahang, especially Encik Amran Shafie, Puan Junaiza, Encik Rudaini, Encik Shahril Izani and Encik Rosli for providing the facilities, knowledge and assistance.

My appreciation goes to the staff of Daiken MDF Sarawak, Mr Ogawa, Mr Takeda and Mr Lim who provided the facilities and assistance during my research in the Daiken at Bintulu Sarawak. A lot of thanks also dedicated to Staff of Forest Research Institued of Malaysia (FRIM) and Micco Chipbaoard Gebeng Pahang for every helping, knowledge and facilities.

Special thanks to my beloved friend, Nur Atiqah Nabilah, Nur Syahirah, Iffah Izzah, Hazwani Alias and all my friends at UiTM Pahang and UiTM Shah Alam for helping and support me with this project. Thanks also to my others colleagues, housemates and friends for helping me during my study as postgraduate student.

Finally, this thesis is dedicated to the loving parents, Razali Hussain and Salma Hamat @ Ahmad for the vision, helping, support and determination to educate me. This piece is also dedicated to my siblings, Nur Nadiah, Nur Hamizah, Muhd Afif Rusyaidi and Muhd Hakim Nizamuddin and others family members who always support and being with me in every situations. Lastly, this piece of victory is for every person who with me between my up and down
