

OPTIMIZATION OF HANDOVER FAILURE  
AND DROP CALL  
IN GSM NETWORK

NUR ISFARIZAL BIN MUHAMMAD © YUSOFF

FACULTY OF ELECTRICAL ENGINEERING  
UNIVERSITI TEKNOLOGI MARA  
MALAYSIA

## **ACKNOWLEDGEMENT**

I take this opportunity to express my gratitude towards my lecturer who is also my project supervisor, Pn Ruhani binti Abd Rahman, for her endless support and guidance in completing this project.

My appreciation also goes to my wife, who's always there for me with her love and support; and En Rasfan b Zainal Abidin, for your continuous assistance to me.

Not forgetting all my friends for the support and lecturers and staffs of UiTM who have directly or indirectly helped me in this project.

## **Abstract**

Handover is one of the important processes in cellular telecommunication system that is continuously considered in order to introduce a good and effective mobile phone service to subscribers. This process is important to avoid drop call but also to let subscribers to achieve a great service on the calls made as they are moving from a point to another in cell, especially the distance from base station increased.

In this thesis, is virtually represented by graphical presentation from TEMS Investigation of ERICSSON. Here, the parameters for handover are observed. The main parameters that are look at including the signal strength, the quality of call and the co-channel interference. The outside factors; fading effect, also attached in this project. Another parameter that is taken into consideration is propagation loss. This is represented by using Microsoft Excel.

The obtained result by using the Microsoft Excel is, when the distance of a mobile from serving cell is increasing, the propagation loss will also increase. This situation will cause handover to initiate. From the TEMS Investigation presentation, it can be seen that handover happens if the stated reasons occur – signal strength, co-channel interference and fading effect, to name a few.

## TABLE OF CONTENTS

	<b>CHAPTER</b>	<b>PAGE</b>
1	INTRODUCTION	
	1.0 Introduction	1
	1.1 History of GSM	3
	1.2 Services provided by GSM	4
	1.3 Cellular Phone service in Malaysia	5
	1.4 Project Objectives	6
2	BASIC CELLULAR SYSTEM	
	2.0 An Early Mobile Telephone Service	7
	2.1 Architecture of the GSM Network	8
	2.1.1 Mobile Station	9
	2.1.2 Base Station Subsystem	10
	2.1.3 Main Switching Centre	10
	2.1.4 Radio Link Aspects	11
	2.2 Cell Panning	11
	2.2.1 Reuse Frequency	13
3	HANDOVER IN CELLULAR TELEPHONE SYSTEM	
	3.0 The Importance of Handover	15
	3.1 Optimisation	17
	3.1.1 Prediction Tool	18
	3.1.2 Switch Report	19
	3.1.3 Drive Test Equipment	19
	3.2 Handover Process	
	3.2.1 Handover based on Signal Strength	21
	3.2.1 Received signal strength rate factors	21
	3.3 Handover based on C/I	24

3.4	Types of Handover	
3.4.1	Intra-Handover	25
3.4.2	Inter-Handover	25
3.5	The Process of Handover	26
3.6	Handover Parameters (Mobile Station in Connection to Traffic Channels)	
3.6.1	Broadcast Messages	27
3.6.2	Information Messages	27
3.6.3	Measurements between Mobile and BTS (in idle mode)	27
3.6.3.1	Cell selection	27
3.6.3.2	Path loss criterion for cell selection and reselection	28
3.6.3.3	Cell Reselection idle mode	29
3.6.4	Measurements in Active Mode	30
3.6.5	Handover Initiation	30
3.6.6	Handover Execution	31
3.6.7	Timers for Handover	32
3.6.8	Finely Synchronous Cells	32
4	PROBLEM CLASSIFICATION	
4.0	Problem Classification	33
4.0.1	Dropped Calls	33
4.0.2	Too Many Handovers	34
4.0.3	Poor Service Quality	34
4.0.4	Wrong Service Cell	34
5	TEMS (TEST MOBILE SYSTEM)	
5.1	Introduction	35
5.2	TEMS Measurement	
5.2.1	RxLev (Received Signal Strength)	35
5.2.2	RxQual (Received Quality)	37
