## **ACKNOWLEDGEMENTS**

I would like to express my thousand thanks to my supervisor, Mr. Muhammad Farid bin Abd Khalid and Mr. Asari bin Sulaiman, for all the guidance given through completion of this study.

I would love to give my special thanks to our coordinator, Mrs. Hashimah Baba for all the patience and support she had given to us.

Not to be neglected my RF Design lecturer, Prof. Zaiki bin Awang for guidance given through designing this final year project.

To all the personnel that had lent their hand and knowledge to be shared with me, thank you a lot.

I dedicated this work to my beloved family especially to my mother, Mrs. Zabidah bt. Ibrahim and my late father, Mr. Baharudin bin Ibrahim. To all my other siblings, thanks for all the supports and love all of you had given to me.

## ABSTRACT

A single-arm spiral antenna has been investigated for Wi-fi applications. The main objective of this project is to design and measure the parameters of spiral antenna for Wi-fi applications at frequency range of 2.4 GHz to 2.5 GHz.

The spiral antenna is fed by microstrip line and RT Duroid 5870 is used with specified information including the dielectric constant of substrate ( $\epsilon_r= 2.33$ ), the center frequency ( $f_c = 2.45$  GHz) and thickness ( $t_{sub}=0.5$ mm).

For the spiral antenna design and simulation, the Genesys software is used. A prototype of a circular microstrip antenna has been built and tested by using Vector Network Analyzer (VNA).

Simulated result like return loss, VSWR and input impedance are compared with those obtained from measurement where good agreements are shown.
