ACKNOWLEDGEMENT

This report could not have been written without the help of a number of people. They have contributed towards my understanding and thoughts. In particular, the author would like to take this opportunity to give special thanks to main project supervisor, Puan Hasnida Saad, for her tireless effort, helpful discussion, guidance, technical support on data analysis and critics. Without her continued support and interest, this thesis would not have been the same as presented here.

The author wishes to express sincere appreciation to Prof. Dr. Nasir Mohd Taib and also En. Kamarulzaman Md.Nor. Special gratitude to the Director of Horticulture Department, Malaysian Agriculture Research and Development Institute (MARDI), Prof Dr. Abdul Rahman Milan for his invaluable assistance provided throughout my research studies.

Finally, I would like to thank to my lovely family especially to my father and my mother for being supportive persons to me in finishing my report and fellow friends for their help, encouragement and love. The help and support for all people as presented above are acknowledged gratefully.

ABSTRACT

This paper presents the case study about the capability of banana tree to absorb radio frequency (RF) waves. The results of banana tree were classified into three particular types of medium propagations such as fruits, leaves and trunks. This research was conducted using the spectrum analyzer and a simple set-up on the Yagi-Uda antenna. The distances and height of banana tree from the transmitting antenna are taking into consideration in this data collection techniques. Comprehensive results were performed to find the relationship between the *line-of-sight (LOS)*, antenna (Yagi-Uda), power radiation and also the distance between the transmitter and the receiver that will affect the signal strength reception. From the results obtained, it shows that fruits have more capability to capability to absorb RF waves followed by the leaves and trunk.

TABLE OF CONTENTS

CHAPTER		PAGE
1	INTRODUCTION	
	1.1 Introduction	1
	1.2 Objectives	3
	1.3 Scope of Study	4
	1.4 Problem Statement	5
	1.5 Significance of Project	6
2	LITERATURE REVIEW	
	2.1 Current Research about the Characteristics of Radio Frequency (RF) Waves.	7
3	METHODOLOGY	
	3.1 Flowchart of Methodology	11
	3.1.1 The Illustration of the Experiment	12
	3.2 Test Methodology	14
	3.2.1 Collection of Samples	15
	3.2.2 Data Collection Techniques	16
	3.3 Equipments	17
	3.3.1 Spectrum Analyzer	17
	3.3.2 Yagi-Uda Antenna	20
	3.3.3 BNC Adapter	22
	3.3.4 Coaxial Cable	24
	3.3.5 Flexible Rod	25
	3.3.6 Tape Meters	26

4	RESULTS AND DISCUSSIONS	
4.1	Results and Discussions	27
4.1.1	The Measurements of the Yagi-Uda Elements (By Practical)	27
4.1.2	Calculations of the Yagi-Uda Antenna (By Theoretical)	29
4.1.3	Measurements on the Frequency at the Laboratory	30
4.1.4	The Measurements on the Path Loss	31
4.1.5	Measurements on the <i>line-of-sight (LOS)</i>	35
4.1.6	Method to Measure RF Absorption Capacity for One Banana Tree Sample	38
4.1.7	Method to Measure RF Absorption Capacity for More Than One Banana Trees Samples	44
5	CONCLUSION	
5.1	Conclusion	49
5.2	Recommendation for Future Work	50
