ACKNOWLEDGEMENT

In the name of Allah, the Most Gracious and the Most Merciful

Alhamdulillah, all praises to Allah for the strengths and His blessing in completing this thesis. Special appreciation goes to my supervisor, Dr Idnin Pasya Ibrahim, for the patient guidance and advice he has provided, for his supervision and constant support. I have been extremely lucky to have a supervisor who cared so much about my work, and who responded to my questions and queries so promptly. His invaluable help of constructive comments and suggestions throughout the experimental and thesis works have contributed to the success of this research.

Next, I would like to express my gratitude to my EE700 buddies, for their support and help towards my postgraduate affairs. I will always appreciate all they have done; I am indebted to them for their help. Completing this work would have been all the more difficult were it not for the support and the friendship provided. All of you have been my best cheerleaders.

Not forgotten, my appreciation to my father, mother and brother, for their support both financially and emotionally, for their endless love. Finally, sincere thanks to Amy, who experienced all of the ups and downs of my research.

Thank you.

ABSTRACT

Nowadays, ultra wideband (UWB) signals has become a solution to most important problems in observing radar target due to various advantages brought by its frequency diversity. UWB permits better data to be acquired due to frequency dependence and the high time resolution of the scattering centres over the extremely wide bandwidth. On the other hand, multi-input multi-output (MIMO) antenna systems have been developed in recent years to improve target detection and localization. MIMO radars exploit non-correlated channel co-efficient between signals from different transmitter and receiver pairs to improve the information received from the response. Motivated by the benefits of using UWB signals, this paper presents the probability of detection by using UWB MIMO radar while considering radar cross section (RCS) characteristics of vehicular targets. A new RCS model will be developed for wideband signal based on actual measurement data. Then, distribution fitting will be carried out to select the best fit to the wideband RCS data. Next, this study will study the detection performance of UWB MIMO radar integrated with the measurement-based RCS model; through numerical simulation of the radar performance. Simulation results indicated that the detection performance was better in terms of signal-to-noise ratio (SNR) when using full band UWB signal in MIMO radars, compared to using partial bandwidth.

Keywords - Ultra Wideband, UWB, Multi-input Multi-output, MIMO, Radar Cross Section, RCS.
