ABSTRACT

Kelempayan is a fast-growing species which provides both opportunities to satisfy the increasing need for wood composites and contribute to reduce environmental issues. The main objective of this study is to determine the properties of Kelempayan particleboard under the laboratory conditions and to evaluate the potentials of Kelempayan wood. Alkaline treatment was conducted to remove barrier for the interaction of particle and resin to develop particleboard with better physical and mechanical properties. The effect of alkaline treatment on chemical properties of Kelempayan, physical and mechanical properties of particleboard were determined. Samples for the physical properties evaluation were prepared from three portions, bottom, middle and top, at near pith, intermediate and near bark radial positions of the tree. Sampling and preparation of samples for physical and chemical analysis were conducted according to the standard Technical Association of the Pulp and Paper Industry USA (TAPPI) T 208 om-94 (1996). In the manufacture of untreated and treated particleboards, Kelempayan wood was used as the raw material and phenol formaldehyde (PF) resin as a binder. This experimental design involved four essential variables, namely, particle size, board density, resin content and hot press temperature for untreated boards. The variables involved in manufacturing of treated boards were particle size and alkaline concentration. Bending strength, internal bond strength and thickness swelling tests were evaluated for particleboards performance. Preparation of test samples and evaluation of board performance were carried out according to Malaysian Standard (MS, 2005). From this study, the statistical analysis revealed that tree portion and radial position significantly affect the physical properties. Chemical properties from bottom to top portion of the tree did not show any significant difference. For particle analysis, particle size was found to affect particle geometric characteristics. In the manufacture of untreated particleboards, all parameters including particle size, board density, resin content and hot press temperature had significant effect on physical and mechanical properties of boards. For chemical analysis of treated samples, alkaline concentration had significant effect on chemical composition. In manufacturing of treated particleboards, both main parameters of particle size and alkaline concentration significantly affect the physical and mechanical properties of the boards. It was concluded that alkaline treatment was effective to improve mechanical and dimensional stability of particleboards from Kelempayan wood. Correlation of particle characteristics, physical and chemical properties had less association with board properties. Regression analysis of the data revealed that there is a very good relationship between the manufacturing parameters and board properties

ACKNOWLEDGEMENT

Many people have contributed directly or indirectly to make this thesis possible. The author would like to express her gratitude and sincere appreciation to her advisor, Assoc. Prof. Dr. Wan Mohd Nazri Bin Wan Abdul Rahman for his patience, invaluable knowledge, constructive guidance and constant encouragement throughout every stage of the study.

The author also likes to thank her co-advisor, Prof. Dr. Jamaludin Bin Kasim for his suggestion help and inspiring the author to get through the difficult stage of study.

Special thanks are extended to Institute of Graduate Studies of Universiti Teknologi MARA Malaysia for providing fellowship scheme. Without the funding support, the author would not be able to support herself to complete the study.

The author also gratefully acknowledged Center of Wood Industries of Universiti Teknologi MARA Pahang for providing Kelempayan trees and necessary facilities for testing equipment, Malayan Adhesives and Chemicals (MAC) Sdn. Bhd. for providing adhesive for this study. The author also heartily thanks Mr. Rudaini, Mr. Shahril, Mr. Khairil, Mr. Nazri, Mr. Muslim and colleagues for the kind assistance during the implementation of this study.

Finally, this thesis is dedicated to her late father, Allahyarham Mohamed Tamat and her mother, Rogayah. The author wishes to express a very special appreciation to her husband, Mohd Sham and her sister, Nor Sazwani for their sacrifices, understanding and emotional support during the preparation of this thesis.

TABLE OF CONTENTS	vi
LIST OF TABLES	xii
LIST OF FIGURES	xv
LIST OF PLATES	xviii
LIST OF ABBREVIATIONS	xix
CHAPTER ONE: INTRODUCTION	1
1.1 Background of Study	1
1.1.1 Particleboard Industry in Malaysia	1
1.2 Problem Statement	4
1.3 Significance of the Study	7
1.4 Objectives of the Study	7
1.5 Scope and Limitations of the Study	8
CHAPTER TWO: LITERATURE REVIEW	9
2.1 Wood-Based Industry in Malaysia	9
2.2 Wood Composites	12
2.3 Raw Material Supply for Wood Composites	13
2.3.1 Rubberwood	15
2.3.2 <i>Acacia mangium</i>	17
2.3.3 Mixed Tropical Hardwood Wastes from Sawmill	19
2.3.4 Forest Plantation Species	20
2.3.5 Kelempayan	23

2.3.5.1	Distribution	24
2.3.5.2	Properties of Kelempayan	25
2.4	Particleboard Manufacture	25
2.4.1	Definition	25
2.4.2	Types of Particles	26
2.4.3	Particleboard Manufacturing Process	28
2.4.3.1	Particle Preparation	28
2.4.3.2	Drying and Screening	28
2.4.3.3	Blending	29
2.4.3.4	Mat Forming and Finishing	31
2.4.4	Wood Modification	32
2.4.4.1	Thermal Modification	33
2.4.4.2	Impregnation Modification	33
2.4.4.3	Surface Modification (Alkaline Treatment)	34
2.5	Properties	38
2.6	Uses	39
2.7	Factors Affecting Particleboard Properties	40
2.7.1	Effects of Particle Size	41
2.7.2	Effects of Resin Content	41
2.7.3	Effects of Board Density	42
2.7.4	Effects of Hot Press Temperature	43
2.8	Types of Particleboard	44
2.9	Particleboard Market Development	45
 CHAPTER THREE: RESEARCH METHODOLOGY		51
3.1	Experimental Design of Study	51
3.1.1	Stage 1: Properties of Untreated Particleboard from 2 mm Particle Size	51
3.1.2	Stage 2: Properties of Untreated Particleboard from 0.5 and 1.0 mm Particle Sizes	52
3.1.3	Stage 3: Properties of Alkaline Treated Particleboard	53
3.2	Raw Material Procurement	56
3.3	Sampling for Physical and Chemical Properties Determination	57
3.3.1	Sampling for Physical Properties	57
