

ACTUATOR AND CONTROLLER DESIGN FOR THE INVERTED
PENDULUM ON A CART DRIVEN BY A BELTING SYSTEM

Thesis presented in partial fulfilment for the award of the
Advanced Diploma in Electrical Engineering of
INSTITUT TEKNOLOGI MARA

ACKNOWLEDGEMENT

In the name of ALLAH s.w.t, The Most Beneficent, The Most Merciful. It is with deepest sense of gratitude of the Almighty ALLAH who gives me the strength and ability to complete this project and thesis as it is today.

My sincere thanks to Ir. Dr. Syed Abdul Kader Al-Junid, supervisor of the project for his advices, patience and time to make sure of the successful of this project and thesis.

To all my friends who give me a lot of supports and encourage, thanks for being good listeners and advisors. To all lecturers and technicians who have been involved in this project, thank you very much.

Finally, I would like to express my gratitude to my parents, families and especially to my dearest sister, Suzana, for their caring, understanding, encouragement and support for the whole time I was in ITM.

ABSTRACT

The inverted pendulum is one example of an unstable system and is a classical problem in control theory. Many different approaches in construction and control methodologies have been studied by different researchers in order to solve this problem. The main objective is to keep the inverted pendulum in the vertical position i.e. in the balanced condition. In this project, a single inverted pendulum on a cart is balanced by moving the cart forward and backward using a pulley-belt transmission system. The plant parameters are obtained experimentally in the laboratory. A suitable actuator has been chosen to drive the cart. The state-space pole-placement technique controller has been designed, to balance the inverted pendulum. Simulation results show that the inverted pendulum can be balanced.
