ACKNOWLEDGEMENT

In the name of Allah, who is the Most Gracious, and The Most Merciful

I would like to express my appreciation to my supervisor, Pn Radziah Ali for her support, guidance and cooperation that have been given to me throughout this project. I also like to thank to Dr. Saadiah Yahya who had been guiding the writing of this report from the beginning until it is completed.

ABSTRACT

In today's world, the use of computers has become pervasive in business, government, the military, and even at home. A lot of vital and sensitive data are being transmitted over the net that includes records on individuals like medical, financial, businesses assets, and payroll. Virtual Private Networks (VPNs) play a major role here and are set to revolutionize security on the Internet by providing a flexible, scalable and comprehensive information security solution. A VPN is an enterprise owned and managed network solution using existing dedicated networks, the Internet or a combination of both, to securely communicate information. This project will cover on differences between these two tunneling services and at the same time, searching for the L2TP and PPTP benefit and to study the security of these protocols. It can be state that L2TP is more secure than PPTP, especially when it combines with IPSec to provide encryption method called L2TP/IPSec. By using it data that travel cannot be access by the outsiders.
