**Final Year Project Report Submitted in  
Partial Fulfilment of the Requirements for the  
Degree of Bachelor of Science (Hons.) Technology and Plantation Management  
in the Faculty of Plantation and Agrotechnology  
Universiti Teknologi MARA**

**JULY 2019**

## **ACKNOWLEDGMENTS**

Alhamdulillah and all praise to the Almighty Allah S.W.T for the endless blessing upon me on completing my final year project report almost successfully. The writings for this final year project have been a lot of ups and downs and been the most important challenging that I have ever been encountered during my study. It is also a grateful pleasure with contribution and support from many participants whomever directly and indirectly in completing this final year project.

The first and most important thing, I have to thank my research supervisor, Dr. Darius El Pebrian. Without his assistance, help and dedicated involvement, I may not be able to complete my writings and through every step that it took to complete this paper. I am deeply grateful and thankful to have such a supportive and understanding supervisor.

I also would like to thank the experts especially for En Fauzi, En Hafiz and the faculty management in Universiti Teknologi Mara (UiTM) Campus Melaka in helping me to do this research. Without their help and participation, I would not be able to finish the data taken to complete my report.

Next, I would like to show my appreciation to my family especially my parents, Sazali bin Sajidin and Intan binti Yaakub for always being so patience and support throughout this thesis emotionally and financially. With their prayers, support, love and motivation, I am able to complete the thesis.

Lastly, I would like to thank all my classmates and seniors for their help and moral support in finishing this study. Finally, I would love to thank for those who are directly and indirectly involved in finishing my thesis but I did not mention their names. I appreciate every help, support, and kindness that has been given to me. Thank you very much.

## **ABSTRACT**

### **FIELD PERFORMANCES OF AUTOPILOT AND CONVENTIONAL MODES IN DRIVING A TRACTOR: A PRELIMINARY COMPARATIVES STUDY ON A ROUGH-MODERATE OBSTACLES TERRAIN ENVIRONMENT**

#### **ABSTRACT**

As the agricultural rose up in this era, many agricultural tractors are being introduced with new improvements. This is to ensure that the farmers can maximize the tractor to obtain high productivity and no longer depend on the conventional tractor. However, field conditions play a role in determining the most suitable driving mode on the farm. Hence, a comparative study was carried out to compare the field performances between conventional driving and autopilot driving modes in a rough to moderate obstacle terrain environment. New Holland Td5.75 tractor with the POLAR Heart Rate Monitor was used to record the data for comparing the heart rate, energy expenditure and the effective field capacity (EFC) between conventional manual and autopilot driving mode in a tractor. Replication was made 3 times for each driving mode. The result was analyzed by using Statistical Packages for the Social Science (SPSS) version 22. The findings showed that both mean increases in heart rate and energy expenditure of the operator driving tractor with autopilot and conventional mode are significantly different. Meanwhile, the effective field capacity of the tractor driving with autopilot mode was higher as compared to the conventional driving mode. Generally, the conventional driving mode works better at rough to moderate obstacles terrain environment. However, a proper further study needs to be done with more numbers of operators with appropriate temperature to obtain the accurate result.
