STUDY AT PERUSAHAAN OTOMOBIL NATIONAL BERHAD.

## ACKNOWLEDGEMENTS

The students wish to express their sincere gratitude to Tuan Haji Razmi Chik, the Project Advisor, for his valuable suggestions, beneficial and fruitful advices throughout the preparation and completion of this thesis and En Mohd Nasir Abdul Razak from Body Engineering Section for his guidance and time.

Similarly, the students wish to acknowledge the suggestions and assistance given by the following persons:

Tuan Haji Fuad Bahari  
Lecturer of Mechanical Department  
School of Engineering  
MARA Institute of Technology  
SHAH ALAM

En Mohd Shukri Hamidi bin Abdul Hamid  
Senior Manager  
Engineering Department  
PROTON

En Mohd Azeman Ridzuan  
Manager  
Body Engineering Section  
PROTON  
and  
all Body Engineering Section executive and staff

Mr Goh Cher Wen  
Executive Director  
Rovski Sdn Bhd

En Zainuddin Jalil  
Service manager  
Dynaflo Sdn Bhd

## ABSTRACT

PROTON's commitment to producing quality cars at competitive prices has always been at the forefront activities. Towards this end, continuing efforts are made to "reduce cost" as well as to increase local content in the manufacturing of PROTON cars. Along with the objective of increasing local content, PROTON has developed and nurtured the growth of local vendors in the automotive parts and components industry.

Efforts to reduce production costs and enhance operation efficiency was intensified with the formation of the "Target Cost Achievement (TCA) Committee". The TCA committee focuses its attention on reducing component costs in respect to design review, product contents, design specification and manufacturing processes. The cooperation of the PROTON's vendors have been enlisted to support this effort.

This thesis provides a case study on direct material, sealants and adhesives that have been used to assemble a White Body for Proton Wira. According to the AOS diagram the cost of sealants and adhesives that should be used is RM41.88. However the actual usage of sealants and adhesives is not consistent, and it was found that the cost was only RM33.19.

Because of the inconsistency usage of the sealants and adhesives, the reference of reducing cost of the material is based on actual usage of RM33.19. The target of this case study is to reduce the cost up to 10% from the actual usage. During the cost reduction analysis, it is imperative to remember that the White Body cost reduced should be within the standard that has been set by Proton.

The approach used to the analysis of cost reduction is by using Man, Method, Material, Machine and Cost. Most of the cost reduction analysis is concentrated to the minimization of wastage of the materials. The minimum inventory system also contribute to the reduction of cost and towards the end the JIT system is suggested to be implemented at Proton.

The WIRA and other incoming new models and cosmetic changes are PROTON's significant achievements, on line with PROTON goal of being a fully integrated automotive manufacturer besides achieving the nation's objective of Vision 2020.

COST REDUCTION ANALYSIS ON A CAR MANUFACTURING PLANT -  
APPLICATION OF SEALANTS AND ADHESIVES AS DIRECT MATERIAL ON  
ASSEMBLING "WHITE BODY" FOR PROTON WIRA (MODEL M-41) - A CASE  
STUDY AT PERUSAHAAN OTOMOBIL NATIONAL BERHAD.
