## ACKNOWLEDGEMENTS

In the name of Allah the Most Powerful and the Most Merciful,

Alhamdulillah, I am using this opportunity to express my gratitude to everyone who supported me throughout finishing this thesis. I am thankful for their aspiring guidance. I am sincerely grateful to them for sharing their truthful and illuminating views on a number of issues related to the project.

First of all, I express my warm thanks to my supervisor, Associate Professor Hj Mohd Tahir bin Abas for his patience, motivation, enthusiasm, and immense knowledge. His guidance helped me in all the time of research and writing of this thesis.

I would also like to thank my co-supervisor, Dr. Mohd Zahari Abdullah @ Rafie for his invaluable constructive criticism and friendly advice during the project work.

My gratitude also to my program project coordinator, Dr. Aiza binti Harun for her encouragement and reminder about all the important dates.

Greatest thanks to my beloved parents, family and friends for their support, encouragement, insightful comments and prayer. I really appreciate the meaningful knowledge and guidance that they had shared with me.

Last but not least, I would like to thank my lab assistant guide Mr Fauzi and all the people who provided me with the facilities being required and conducive conditions for my thesis project.

Nur Izatul Nabila bt Mohd Ali Hanafiah

## **ABSTRACT**

### **HEAVY METALS ACCUMULATION IN TOPSOIL SURROUNDING TEMERLOH INDUSTRIAL AREA**

There are various types of heavy metal that may contain in the topsoil. Heavy metal is the metal that can give adverse effect to human health and environment. The objectives of this study are to determine the concentration of heavy metal that present in the topsoil obtained from the distance near to Malaysian Newsprint Industries in Temerloh Industrial Area, to determine the level/degree of airborne heavy metals contamination and also to study the long term effects of heavy metals accumulation in the topsoil. Heavy metal that were analyzed were zinc (Zn), copper (Cu), cadmium (Cd), iron (Fe) and lead (Pb). In this study, after the samples had been air dried and grinded, the samples were extracted using Acid Digestion Method, then these heavy metals concentrations in the sample were determined using Atomic Absorption Spectroscopy (AAS). Concentration of Zn, Pb, Cu and Fe in the samples were determined using Flame Atomic Absorption Spectroscopy (FAAS) while the concentration of Cd in the sample was determined using Graphite Furnace Atomic Absorption Spectroscopy (GFAAS). The mean concentration obtained for the whole sampling site were found in the range of 0.060 to 0.240 mg/kg for Cd, 2970.00 to 4540.00 mg/kg for Fe, 230.00 to 918.00 mg/kg for Zn, 5.00 to 40.00 mg/kg for Pb and 6.00 to 37.00 mg/kg for Cu. In conclusion, Zn had the highest concentration compared to Fe, Cu, Cd and Pb in the topsoil and this heavy metal distribution data is under USEPA Standard and is very useful to be a good reference and guideline for soil remediation. Based on the statistical analysis using the contamination factor and ecological risk factor, the studied area is moderately polluted by the heavy metal. This study also shows that the effects of pollution to the surrounding area possess a moderate health effect to the surrounding area.
