## ACKNOWLEDGEMENT

Assalamualaikum w.b.t.

Praise to Almighty Allah S.W.T the most gracious and the most merciful for His blessing that give me healthy physical and mental to finish this project within the given time. Thank you to my supervisor, Madam Junaiza Binti Ahmad Zaki, whose willingness to contribute her knowledge, time and effort had made it possible for me to complete my final project. Not forget to our co-supervisor, Miss Nur Hannani Binti Abdul Latif that always helps in finish my final project. My never ending gratitude also extends to her guidance. I gratefully acknowledge her helpful suggestions. Thank also for Miss Caroline Joseph (Lecturer at Language Department) because spend time to correct the grammar of this thesis.

My thanks also go to the all the lecturer and staff in Department of Furniture Technology, especially Dr. Wan Mohd Nazri Wan Abdul Rahman as Coordinator for Final Project and also Mr. Ahmad Fauzi Awang for his help in completing this project. My deepest appreciation also to Prof Dr. Jamaludin Kasim, Head of Wood Technology Centre. Without their help, support and contribution, this project cannot run smoothly and complete. Last but not least, all my friends that always gives me support physical and mental.

For all people that always give me strength. For all of your kindness, I really appreciate it. May Allah bless you all. Thank you so much.

# **BENDING STRENGTH PROPERTIES OF ENGINEERED SLICE LUMBER FROM OPT MIXED WITH LOW DENSITY HARDWOOD**

By

Mohd Fadhli Bin Othman

JANUARY 2013

## **ABSTRACT**

The bending strength properties of Engineered Slice Lumber (slice cut) from Oil Palm Trunk (OPT) mixed with Low Density Hardwood are being determined. Low Density Hardwood such as Kelempayan (*Neolamarckia cadamba*), Sesenduk (*Endospermum malaccense*) and Acacia (*Acacia mangium*) has never been regarded as structural material due to their inferior strengths. The qualities of boards are evaluated by determining the bending strength properties that consist of modulus of elasticity (MOE) and modulus of rupture (MOR). The comparison of bending strength properties in different species, shows Acacia is suitable to be used in manufacturing of Engineered Slice Lumber (slice cut). On the other hand, the better design of arrangement shows that alternate design gave good properties of bending strength. The bending Strength properties were determined according to the British Standard (BS EN 373:1957), Method of Testing Small Clear Specimen of Timber.
