ABSTRACT

Not-for profit organisations (NPO) are under increased pressure due to the heightened demand of NPOs to demonstrate results/impact on social services provided. With increased accountability requirements, most NPOs are focusing their efforts on establishing and implementing performance measurement systems. Importantly, when an organisation adopts a performance measurement system, it is expected that the data provided by the system is to be used to secure continuous funding and improve their organisation's social mission deliverables. However, many researchers have documented that only a few NPOs use their performance data relatively low in the strategic decision-making process as volunteers predominantly drive the sector, and volunteers cannot typically run the NPOs. In strategic management literature, knowledge management capability (KMC) is increasingly advocated as strategic management that can empower the human capital in the organisation, resulting in higher use of performance information. However, there has been little research on the effects of knowledge management capabilities (KMC) with performance information (PI) use despite the importance of KMC. Drawing on Resource Dependency theory and Knowledge-based View theory, this paper aim to analyse the relationship between KMC and management performance information (PI) use, focusing on six types of KM infrastructure capabilities: human resource management (HRM), organisational culture, decentralise structure, internal marketing, technology and knowledge leadership and four types of KM process capabilities: acquisition, conversion, application and protection process. The NPOs in Malaysia is chosen due to the increasing importance of the sector to the country's economy in delivering public good to every society and the current government initiatives to empower NPOs to be more independent in funding their social missions. A quantitative approach was conducted using a set of questionnaires that were distributed among the manager/owner/trustee of NPOs. The research model was further analysed using the Partial Least Square-Structural Equation Modelling (PLS-SEM) technique. Based on the research questions, this study finds HRM, collaborative culture, innovation culture, decentralise structure, technology and protection process has a significant positive influence on management PI use, while the other capabilities elements have no significant link. This thesis contributes to the relevant empirical evidence, which indicates that HRM, collaborative culture, innovation culture, decentralise structure, technological capability and protection process can be the foundation in formulating the overall KMC strategies in NPOs. The results of the proposed study will assist managers by pointing out areas of strength that NPOs can leverage and the policymaker to assess how effective the current policy has been in empowering the NPOs sector to advance this social sector mission deliverable. Overall, the findings in this study provide an important input that can complement the current initiatives in Malaysia to empower NPOs to be more independent in funding and executing their social missions more effectively.

ACKNOWLEDGEMENT

Firstly, I wish to thank God for giving me the opportunity to embark on my PhD and for completing this long and challenging journey successfully. My gratitude and thanks go to my great supervisor Prof Dr Roshayani Arshad, and my co-supervisor, Dr Rina Fadhilah, for their endless support, commitment, guidance and suggestions towards the end of my journey.

I am incredibly grateful as Allah grant me a great support system throughout this journey. I especially like to express my gratitude to my beloved husband, Mohd Asri, for his understanding and encouraging me along this journey, even though he never comprehends what this journey was all about. To my lovely children, Aisya Afifi and Mohd Aryan, for your thoughtful and considerate. A special thanks to my dearest mother and father (Roshanah & Abdul Razak) for their constant encouragement throughout my research period and the family members and in-laws who always supported me throughout this journey.

I would also like to express my sincere gratitude to everyone who assisted and guided me along this path. Not to forget to all my lovely friends for their great support and encouragement through my PhD journey.

I would like to thank all reviewers for all the comments and guidelines during the pretesting process, which provides valuable input and guidance. Special dedication also goes to Accounting Research Institute, UiTM for their support, and a special thanks go to all respondents who have participated in the study. Thank you very much.

CHAPTER ONE

INTRODUCTION

1.1 Preamble

Not-for-profit organisation (NPO) plays a vital role in providing goods and services towards the advancement of society (Downes, & Marchant, 2016; Rathi, Given, & Forcier, 2016; Colnar, Dimovski, & Bogataj, 2019). In funding the social mission, the source of funds ranges from donations, government grants to revenue generated from social entrepreneurship (Carroll & Stater 2009; Froelich 1999; Frumkin & Keating 2011). Fund providers, as well as the increasing reliance on not-for-profit organisations to address various social issues in many countries, has heightened the demand for NPOs to demonstrate their accountability to the fund providers, constituencies served and for the outcomes created (García, González, & Acebrón, 2013; Akingbola, 2019; Berenguer, & Shen, 2020). In discharging accountability, past literature highlights that performance measurement is essential in demonstrating accountability and making progress toward mission-oriented goals (Kim, John & Pettijohn, 2019; Lee & Clerkin, 2017; Bryan, Robichau, & L'Esperance, 2021).

With increased accountability requirements, most not-for-profit organisations are focussing these days on the establishment and implementation of performance measurement systems (Carman, 2007; LeRoux & Wright, 2010; Morley, Vinson, & Hatry, 2001). As a result, there are various performance measurement approaches in NPOs literature, with no consensus on which performance measurement tools work best in the NPOs sector. Importantly, it is expected that data generated by a performance measurement system would be used not only to secure continuous funding but also to improve the social mission deliverables of the organisation (Lee, 2020, Lee & Clerkin, 2017). In comparison, this has not always been the case in practice, as most NPOs typically aim to meet grant requirements, leaving little room for performance improvement (Lee & Clerkin, 2017). A number of researchers have documented, only a small number of not-for-profit organisations make use of their performance data relatively low in the strategic decision-making process (e.g., Lee, 2020; Lee & Clerkin, 2017; LeRoux & Wright, 2010; Moynihan, 2005; Liket, Rey-Garcia & Maas, 2014).
