ABSTRACT

In numerical analysis there is a system of linear equations which is formed from just a set of two or more linear equations. Iterative methods formally produce the solution of a linear system after an infinite number of steps. Iterative methods can be competitive with direct methods as it provided the number of iterations that are required to converge either independent of n or scale or scales sub linearly with respect to n .

For instances of large sparse matrices, direct methods may be disadvantageous due to the sudden replacement, although exceptionally competent direct solution can be come up with sparse matrices recommending special differential equation. Iterative methods are made achievable by preconditioning techniques that will be address in this project. The iterative methods that will be evaluated in this project are Jacobian method, Gauss Seidel method and Successive Over Relaxation method.

ACKNOWLEDGEMENT

IN THE NAME OF ALLAH, THE MOST GRACIOUS, THE MOST MERCIFUL

Firstly, I am grateful to Allah S.W.T for giving me the strength to complete this project successfully.

I would like to express my gratitude to Puan Ruhana Binti Jaafar and my coordinator of the subject MSP600, Dr. Nor Haslinda Binti Zull Pakkal who assisted me throughout the process of completing this project. Moreover, I would like to thank to all my lecturers that have been teaching me since first semester in UiTM until now.

Next, I would like to thank my parent, Wan Hamad Bin Abdullah and Aspalaila Binti Abdullah, who brought me up with love and words of encouragement. I am sincerely thankful and grateful for all the support. Last but not least, I would like to thank all my friends for their helps in finishing this project. Friendship worthwhile moments throughout my years in UiTM.
